To the Federal Communications Commission in the matter of RM-11708

Matthew Pitts

Having read the latest comments submitted, I am compelled to comment yet again. Reading through the comments of Theodore Rappaport and others, it occurred to me to check to see exactly where the automatically controlled subbands were with respect to the SSB portion of the HF bands, as well as comparing this to what the IARU bandplan was. What I found was interesting in light of the numerous requests to move wide bandwidth data either to a new segment near the SSB portion or into it. This is already the case on most bands, and is in fact the recommended configuration from the IARU Region 2 bandplan. Also, with regards to Automatic Link Establishment stations, as mentioned in the comments of Mark Sihlanik, they already possess listen before transmit technology and are operating in the currently allocated automatically controlled band segments.
