RE: Policies Regarding Mobile Spectrum Holdings, WT Docket No. 12-269; Expanding the Economic and Innovation Opportunities of Spectrum Through Incentive Auctions, GN Docket No. 12-268

Dear Ms. Dortch,

Attached to this letter are 1,318 letters collected by Public Knowledge asking the Federal Communications Commission to make available 24 MHz of spectrum for unlicensed use as part of the upcoming incentive auction.

By reserving 24 MHz of unlicensed spectrum across the country, the FCC will encourage further innovation in wireless services and foster the growth of next generation Wi-Fi. In 2013, unlicensed spectrum contributed over $220 billion dollars to the U.S. economy and this number will only grow if the FCC grants the requests of these writers.

The enormous economic and social value of dedicating this spectrum should enable the FCC to craft an auction that balances the needs of the public and of those companies bidding on the remaining spectrum.

Thank you,

Sean M. Meloy

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Robert Wissel, New Jersey

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Christopher Trice, Illinois

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Brian Boettcher, Wisconsin

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Robert Jackson, Michigan

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Floss Shahbegian, New York

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

David Lambert, New York

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Cynthia Mace, Illinois

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Callie Riley, California

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Meredith West, Illinois

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dj Merrill, Maine

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Anita Scheunemann, New Mexico

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Richard Arrindell, Florida

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Matthew Harrell, Texas

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dan Hancock, Texas

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Beth Darlington, New York

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Shane Worth, DC

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Paul Guarino, New York

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Graylin Grissett, Texas

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Michael Martin, Illinois

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Timothy Hill, Washington

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Matt Kraai, California

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Roy Smith, California

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

John Carter, Illinois

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Nathan Sullenberger, Pennsylvania

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Moya Aiken, Connecticut

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

David Bruner, New York

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Yvonne Barker, Wisconsin

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Jeff Grucella, Wyoming

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Thomas Girvin, Ohio

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Doug Landau, Florida

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Randall Nerwick, Oregon

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Jason Steadmon, Nevada

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Michael Lindsey, Texas

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Gerry Milliken, Arizona

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Patrick Casey, Washington

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Robert Keller, New Jersey

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Neal Gompa, Mississippi

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Alan Mathews, Pennsylvania

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Mark Lundholm, Illinois

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Robin Pasholk, Wisconsin

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Madeline Smith, Oregon

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Manny Gurrola, Arizona

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Erin Yarrobino, New York

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Hillary G. Buckingham, New York

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Joshua Tomaszewski, Illinois

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Peter Ore, Montana

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Jon Reed, Washington

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Andrew Lapointe, Massachusetts

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Bill , Colorado

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Rick , Texas

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Royce , Utah

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Charles , Minnesota

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Dear Chairman Wheeler:

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Andrew , Maryland

In 2013, open spectrum contributed over $220 billion dollars to the U.S. economy. As Commissioner Jessica Rosenworcel recently wrote, finding new opportunities for more open "unlicensed" spectrum is critical for growing the wireless economy, promoting innovation, and keeping us affordably connected to the Internet.

One of the most promising new technologies uses the empty spaces between television channels, the so-called "TV white spaces" (TVWS). The United States currently leads the world in this new technology. In the few short years since the FCC approved use of the TVWS, companies have built and shipped equipment to bring needed broadband to rural communities, creating jobs and expanding opportunities. Unfortunately, the upcoming auction of reclaimed broadcast spectrum threatens to sell off these vacant channels to giant mobile phone companies.

The FCC hopes to reclaim 120 MHz, or 20 television channels, of the "public airwaves" to sell to these private companies. Despite the enormous economic and social value of dedicating some of these reclaimed tv channels to open public use, these wireless companies insist that the FCC sell off all the reclaimed spectrum and leave nothing of the "public airwaves" for the public.

We call on the FCC to set aside 4 reclaimed TV channels, or 24 MHz, for TV white spaces. This will still leave the FCC more than enough to auction to wireless companies for their commercial needs. By reserving 24 MHz of "unlicensed" spectrum across the country for TV white spaces, the FCC will encourage further innovation in wireless services and foster the growth of next generation WiFi contributing billions of dollars in new products and consumer savings.

Signed,

Dorothy , California
