

To whom it may concern,

Global Satellite Engineering provides satellite based solutions for clients both domestically and around the world. This includes IOT support and first hand engineering in the telecom field. Many of our clients domestically use the Globalstar gateway and products to achieve their needs. We understand the potential risk increased WiFi noise levels can have on the Globalstar network and how this can translate into disruption to our client's services. I would ask that the FCC in their notice of inquiry look directly at the numbers of deployed outdoor devices that could affect other networks. I would also ask that they ensure all manufactured devices comply with current FCC antenna regulations and explore the future scale of commercial deployments and their effects on networks like Globalstar as these factors could greatly impact the experiences of our clients..

Kind Regards,
