

# Broadband mapping meeting with FCC Steve Rosenberg and Allison Baker

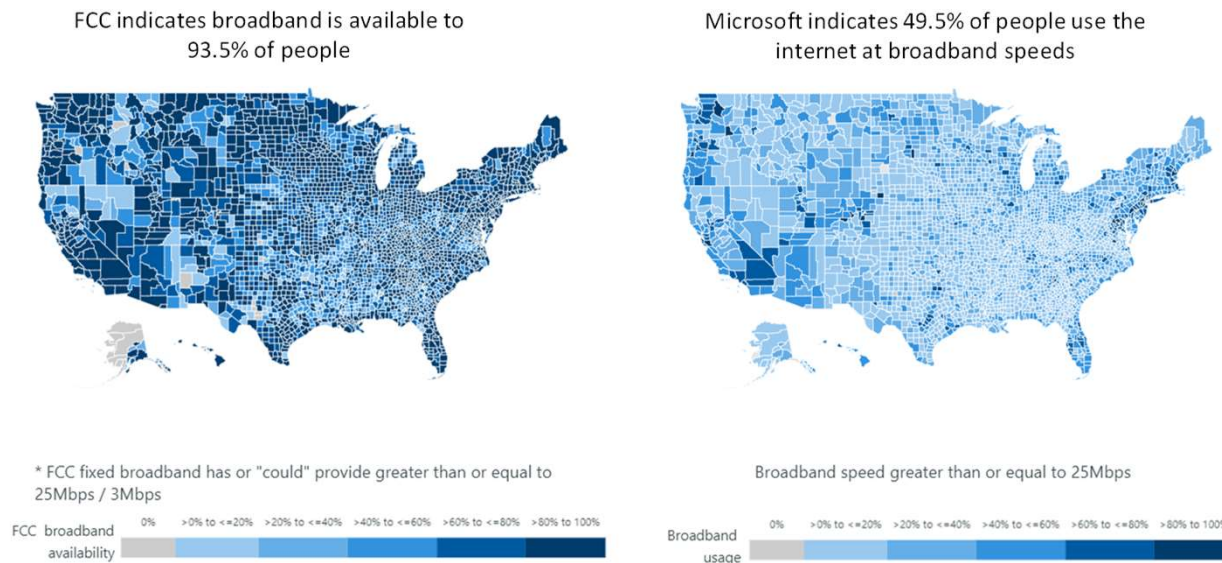

September 18, 2019

## Areas of discussion

- Form 477 vs Digital Opportunity Data Collection order
- Regarding the digital opportunity data collection
  - How are you planning to use the shape files approach to calculate and report availability coverage vs the current census block approach?
  - Are you planning on leveraging both availability and usage data in your crowdsourcing solution?
  - What is the timing?
- Outlier zip code analysis on existing availability data

# Broadband usage based on Microsoft data

- FCC reports 93.5% of the country has access to fixed broadband at a minimum of 25 Mbps/3Mbps; Microsoft estimates ~49% of people access the internet at broadband speeds
  - Availability does not equal usage; however usage gives us the ground truth in the progress we are making in broadband adoption.
  - Through artificial intelligence and machine learning models using device level (no PII) data (over 200+ Microsoft services) we estimate download speeds and broadband coverage
  - We make a very minor adjustment in areas of the country that Microsoft may not have a presence with third party data i.e. ComScore

Data sources: FCC 2019 Broadband report based on Form 477 data from December 2017 and Microsoft data from September 2018

## Objective of the analysis

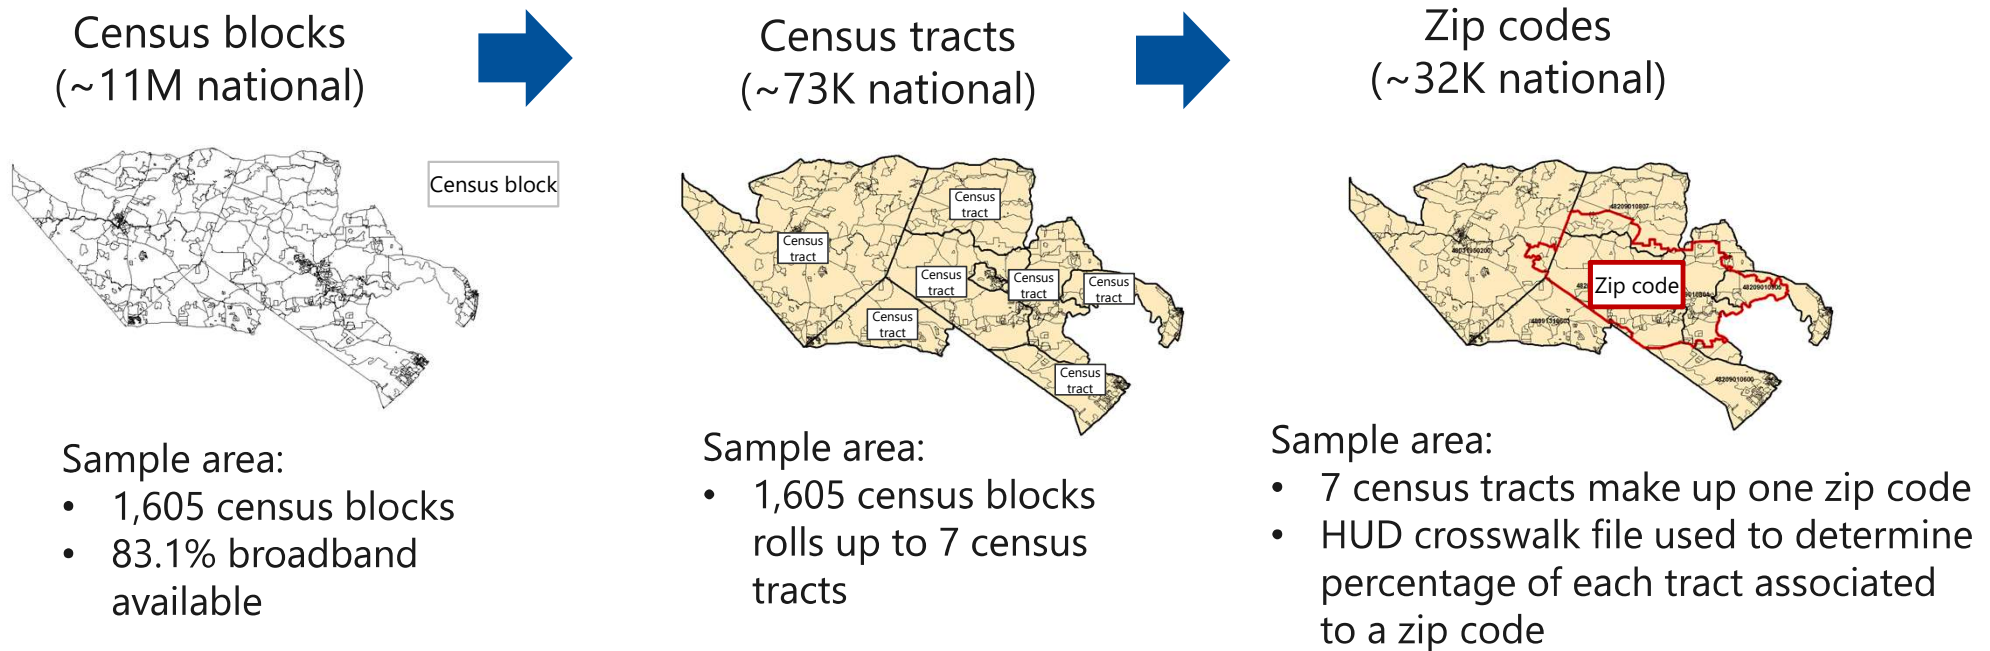

- Hypothesis: If we can find zip codes with inaccuracies in availability data in an automated way using machine learning this could help the stakeholders to correct data inaccuracies.
- Utilizing further machine learning to predict availability, we have created a model to identify a subset of zip codes that MAY have inaccuracies.
- There is no guarantee that these zip codes are being reported inaccurately; however based on using a machine learning model and additional validation with a third-party survey done by BroadbandNow, these identify areas of potential inaccuracies.
- Our plan is to make the model publicly available on GitHub and the output publicly available in the near future.

# Methodology

- Developed Machine Learning models (random forest for regression) to predict broadband availability in order to identify potential outlier zip codes when compared to the form 477 data submitted to the FCC.
- We take the FCC availability data at the census tract level and estimate to zip codes.
- Data sources:
  - FCC Form 477 (grouped by zip code)
  - Broadband usage based on Microsoft data
  - Census data by zip code
  - Broadbandnow.com data
  - HUD census tract to zip code crosswalk

# Zip code availability

- We take the FCC availability data at the census tract level and estimate to zip codes using the HUD crosswalk file

# Predicting broadband availability

- We use a random forest model and measure variable importance.
- Broadband usage is the #1 variable with the highest predictive power followed by percent of farmer and educational attainment.
- At the state level this model can predict with an  $r^2$  of 91%.

Predicted Broadband vs FCC broadband (State Level)

# Ability to detect potential outliers

- We use this model to detect potential outliers with the highest divergence (positive and negative) to the reported broadband availability
  - ML model predicts 63% of zip codes within 5pts of reported broadband availability
  - ML model predicts 78% of zip codes within 10pts of reported broadband availability

## Top 20 potential outlier zip codes

State	Zip code	FCC broadband availability 2019 report	Usage Feb 2019
PA	17949	91.8%	0.0%
VA	22742	100.0%	0.5%
WV	26386	100.0%	9.5%
FL	33890	94.0%	4.7%
