

Dear Mr. Pai,

I am writing to raise my serious concerns about 5G technology. Did you know that 5G technology utilizes harmful millimeter waves to transmit data? Just for context, these millimeter waves are what airport screening machines use. It's not like the current technology that functions on radio frequency. These waves are much, much more powerful. So powerful that they can cause cancer and destroy DNA. I understand that the FCC values economic advantages over basic consumer health protection, but if you let 5G happen, you also will be affected negatively by these waves. I also see that there is a multi-billion-dollar market for this, but if you had to choose between staying healthy and well or getting a few billion dollars, which would you choose? I think the FCC needs to represent the interests of all people, including consumers and those who might be affected greatly by this technology (young children, elderly, etc.), and not just large technology firms. Besides the health issues, there is a huge implementation process which consists of attaching some sort of network box to every utility pole. That costs a lot. The only real benefit that 5G would bring is faster data. Who needs that, really? If you want to watch Youtube videos, you can do so at home on your WIFI network. Clearly, the issues with 5G outweigh the benefits. If you think that what I'm saying is just technophobic, please search up "5G health concerns" and you'll see everything that's scientifically proven to be wrong with 5G. Please understand that I'm only 11 and when I grow up, I don't want to have cancer just because some fraction of corporate people will profit from this harmful technology. Consumers have the right to protect their health from harmful technologies. Please respect that right.

Sincerely,

A member of the future generation of consumers.

P.S. - If all consumers knew about the dangers of 5G, you wouldn't have come so far with deploying 5G. It's not yet too late to stop this technology.
