

As a software engineer, I strongly oppose the proposed changes to the current FCC policy of network neutrality. I support title 2 classification of internet service providers and oppose any changes that would permit the 3-4 isps in the united states to take action against the interests of consumers. The current rules do permit the types of fast lanes that would be needed for telemedicine and accessibility services. It would be much more productive to create specific exceptions to the rule rather than to throw it away.

Thank you for your time
