Licenseless wireless will lower the barrier to entry into the (increasingly necessary) world of what is now considered big bandwidth (1-2Mbps) by replacing a recurring cost (the local loop) with a one-time wireless transceiver cost. This cannot do anything but help the growth of the National Information Infrastructure. since, at its heart, it's all about getting people on the 'net.

Hi People,

Just to put my two cents in: I'm presently living in Ottawa, Ontario, Canada (aka Silicon Valley of the North). Americans make up well over 90% of the online community. As a consequence American legislation/regulation makes huge waves on the net. This is not to say the US makes global policy by making national policy, but it sure makes a global impact!

Access has been, and remains one of the central issues surrounding the internet. ANYthing which would lower the cost, or allow a larger group of people access must be seen as a move towards a more democratic society: A society where everyone has a voice is surely an ideal we as a global community should be striving towards.

Sincerely,

Nadim Ghaznavi

Greetings,

I would like to voice my support for the "NII/SUPERnet" now being considered.

A free or low cost wireless system would be an enormous asset to the public, especially the people or organizations who otherwise could not afford access.

Thank you,

Xwo@aol.com
