

Next Generation Indoor Location for Public Safety

Marc Linsner
Consulting Engineer
September 25, 2014

The Challenge:

Locating a caller to 9-1-1 using their cellphone while indoors

- **By design** the cellphone network device location architecture is built for outdoor location (i.e. GPS).
 - Most people used their wire-line phone while indoors
 - Now, 40% have '**cut the cord**'
- 70% of all 9-1-1 calls come from cellphones
 - It's the go-to device
- GPS, however, doesn't work well indoors
 - Particularly acute in **dense urban environments**

Leveraging “Baked-In” Technologies

- Improved GPS technology
 - Universal, but incremental, improvement for indoor 9-1-1
- Residential Wi-Fi
 - Important for calling 9-1-1 from “where we live”
- Enterprise Wi-Fi
 - Important for calling 9-1-1 - from “where we work”
 - Important for calling 9-1-1 from “where we learn”
 - Important for calling 9-1-1 from “where we play”

Today’s discussion

Enterprise Wi-Fi Collaboration Has Already Begun

TCS engineers are working with Aruba engineers to integrate AirWave Wireless Management System into this solution.

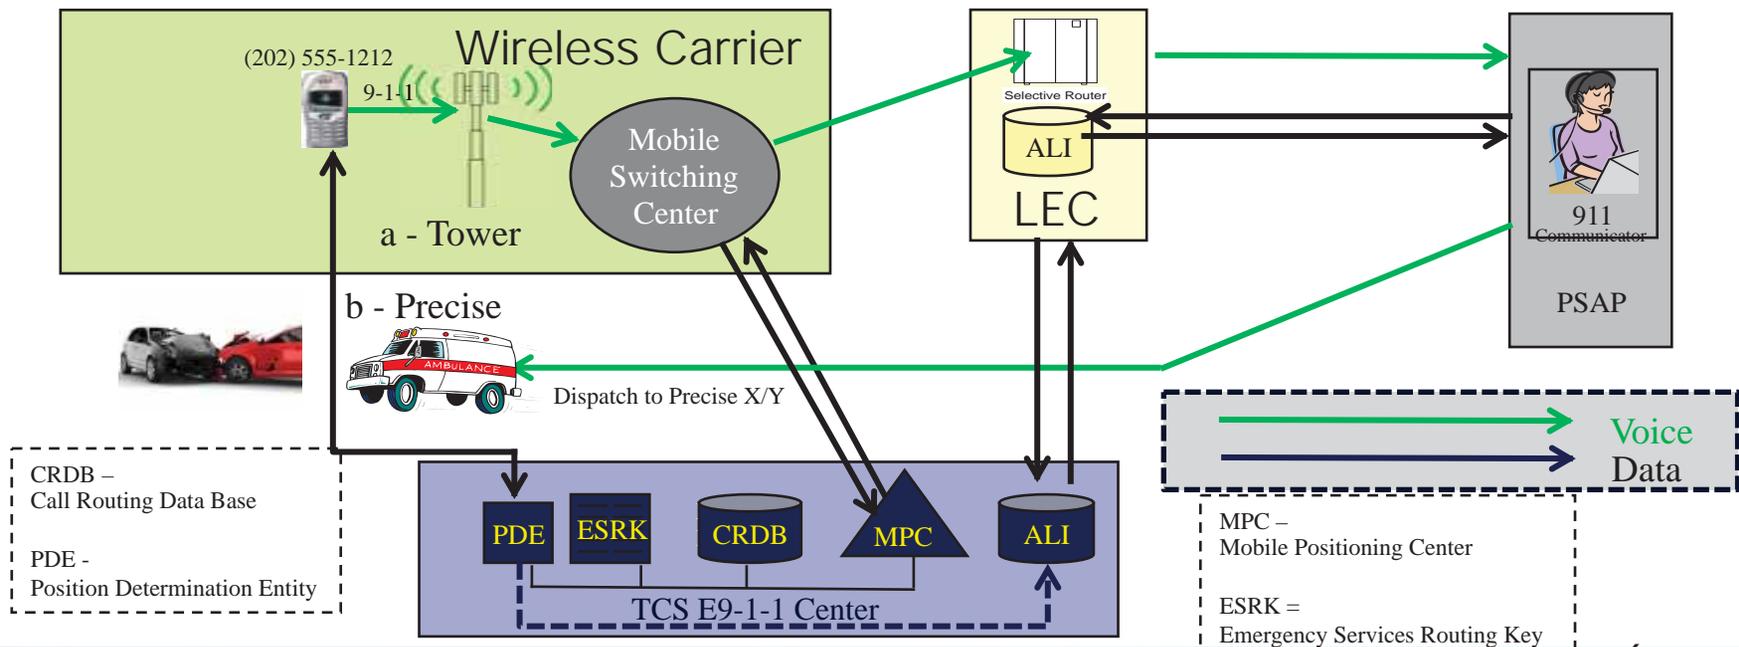

In early talks with Ruckus Wireless to integrate their cloud-based solution.

What is the FCC's Role?

- Don't foreclose this approach with a different decision
- Allow dispatchable location to count toward compliance
 - Dispatchable location should be the "gold standard"
 - Providing dispatchable location should meet highest FCC criteria
- Explore need for enterprise network-specific public safety requirements

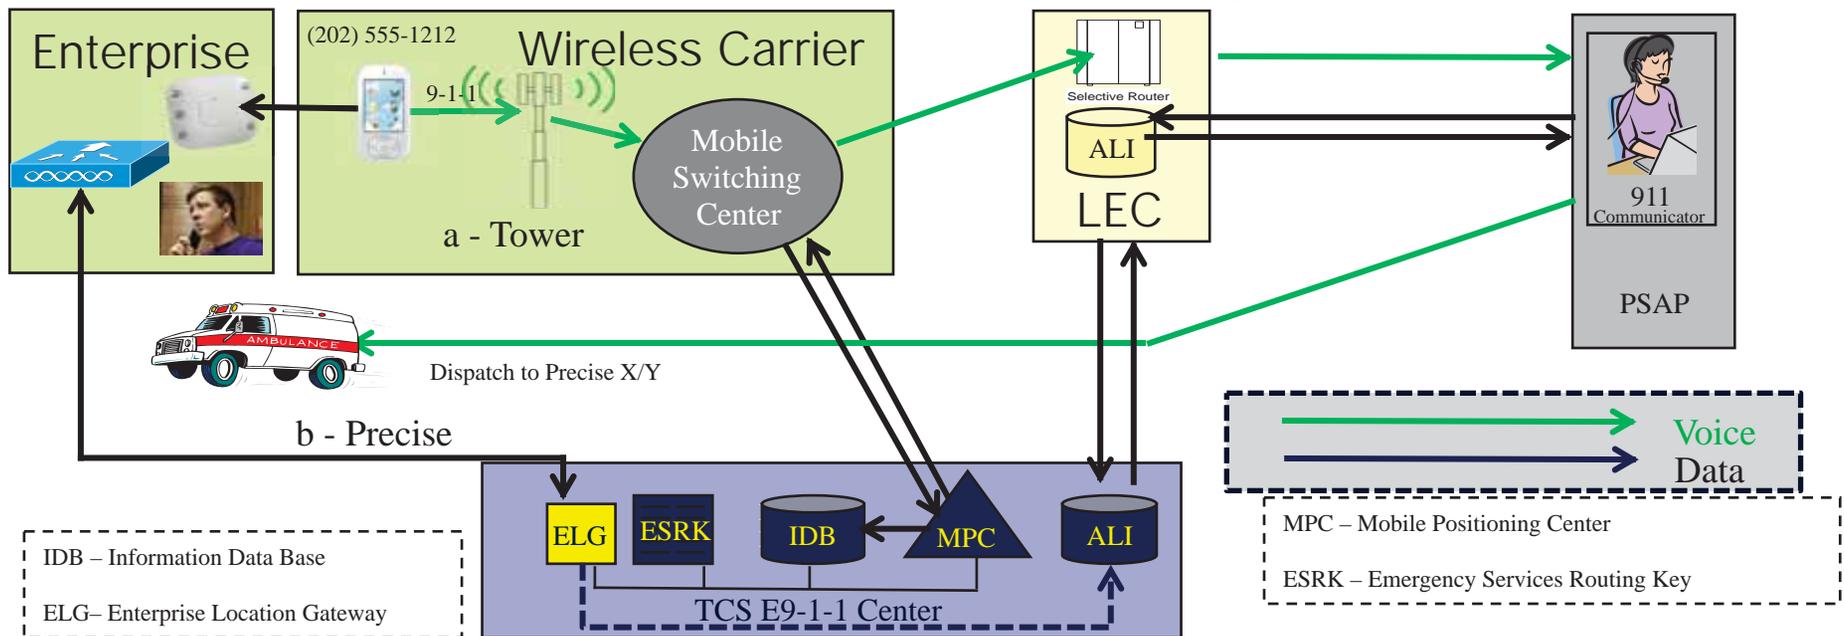

Wireless E9-1-1 Call/Data Flow: A Baseline

- 1: Person dials 9-1-1
- 2: MSC requests routing instructions
- 3: MSC routes call to PSAP
- 4: E9-1-1 Center gets precise location
- 5: PSAP queries for precise location
- 6: PSAP dispatches assistance

Wireless E9-1-1 Call/Data Flow: Indoor 9-1-1 Call

- 1: Person dials 9-1-1
- 2: MSC requests routing instructions
- 3: MSC routes call to PSAP
- 4: E9-1-1 Center queries MSE for location
- 5: PSAP queries for precise location
- 6: PSAP dispatches assistance

Where's the 9-1-1 caller?

The screenshot displays the TCS GEM911 web interface. At the top, there is a navigation bar with the TCS GEM911 logo, a 'Help' link, and a 'Sign Out (Lance Pitt)' link. The main content area is divided into three columns. The left column shows a list of active sessions, including 'My Active Sessions' with a session for '1-206-321-7809' by 'Lance Pitt', and 'Other Active Sessions' with sessions for '1-425-877-4300 (1)' and '1-206-518-0767' by 'Rod Robinson'. The middle column displays a 'Message Transcript: 1-206-321-7809' with a blue message bubble saying 'Testing outdoor 911 location' and a green response bubble saying 'You have reached 911. Where is the emergency?'. Below the transcript is a 'Select an immediate response' dropdown menu with the selected option 'You have reached 911. Where is the emergency?'. The right column features a map of a city area with a red location pin and a 'Refresh Location' button. Below the map, location data is provided: 'Located At: Sep 18 7:44:10 PDT', 'Latitude: +38.89417', 'Longitude: -77.02028', 'Hor Uncertainty: 148', 'Position Source: 135', and 'Status: Location Found'.

CSRIC III Testing – Using outdoor mechanisms to locate devices that are indoors

The dense urban buildings used for indoor testing in this stage of the test bed were:

- Bldg. 1: Marriott Marquis Hotel, SF
- Bldg. 2: One Front Street, SF
- Bldg. 3: 201 Spear Street, SF
- Bldg. 14: The Hearst Office Building (699 Market Street), SF
- Bldg. 15: The Omni Hotel, SF
- Bldg. 16: One Embarcadero Plaza, SF

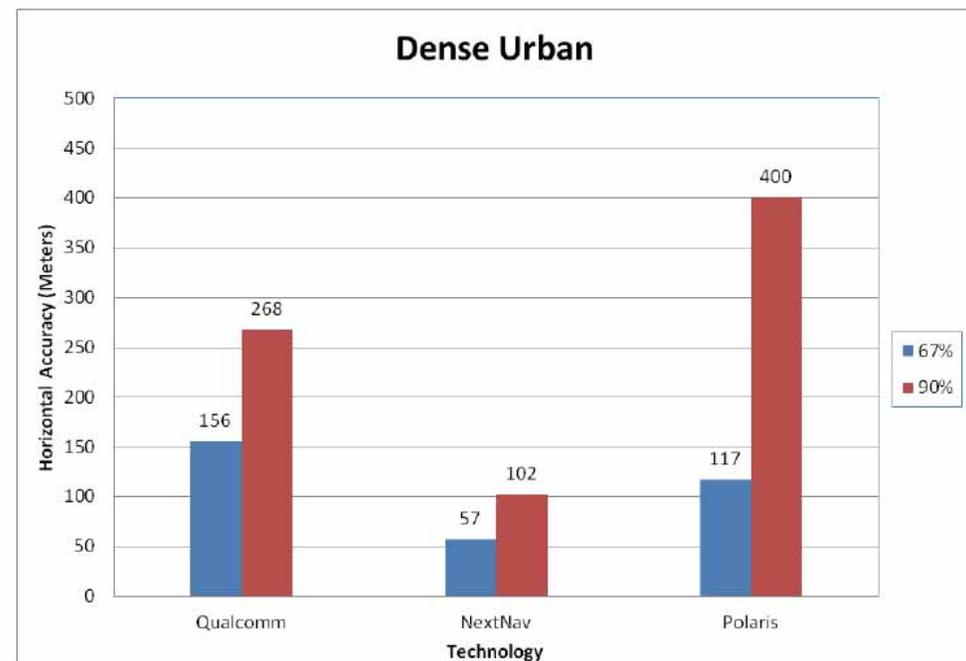

Figure 7.3-2 Accuracy Percentiles in the Dense Urban Environment

A "dispatch-able" location?

- Current and tested technologies deliver an X, Y, Z coordinate
 - Requires reverse geocoding for dispatch
 - How does the Z coordinate equate to a floor number?
- X, Y, Z is good for outdoors, but not indoors
- Cisco office at:
 - 601 Pennsylvania Avenue, N.W. North Building
 - Suite 900
 - Washington, District of Columbia, 20004
- Public Safety would get:
 - 38 53.599' N 77 01.216' W
 - Elevation 149'

Alternative Approach: Enterprise Wi-Fi

Enterprise Wi-Fi becoming ubiquitous

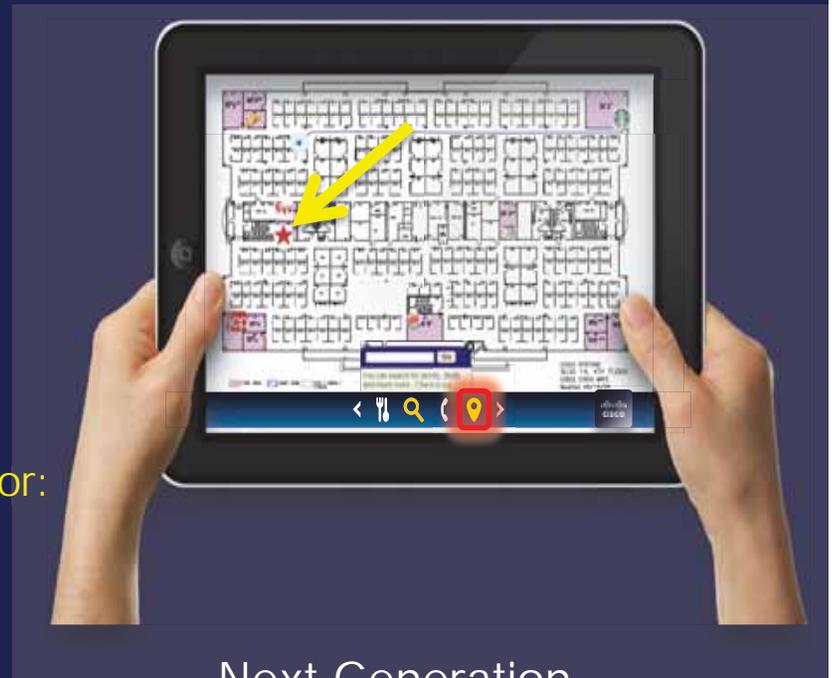

- 60% of cellphones now smartphones w/WLAN interfaces
- Up from 40% just a couple of years ago
- Device location is built-in (802.11)

Growing subset of Enterprises use Device location for:

- Asset Tracking
- Customer Habit Awareness
- Facilities Planning

Location technology can be accessed by Public Safety

- "Dispatch-able" Location
- Initially: Civic address & floor number (for legacy)
- Next Gen: Floor plans and real-time data

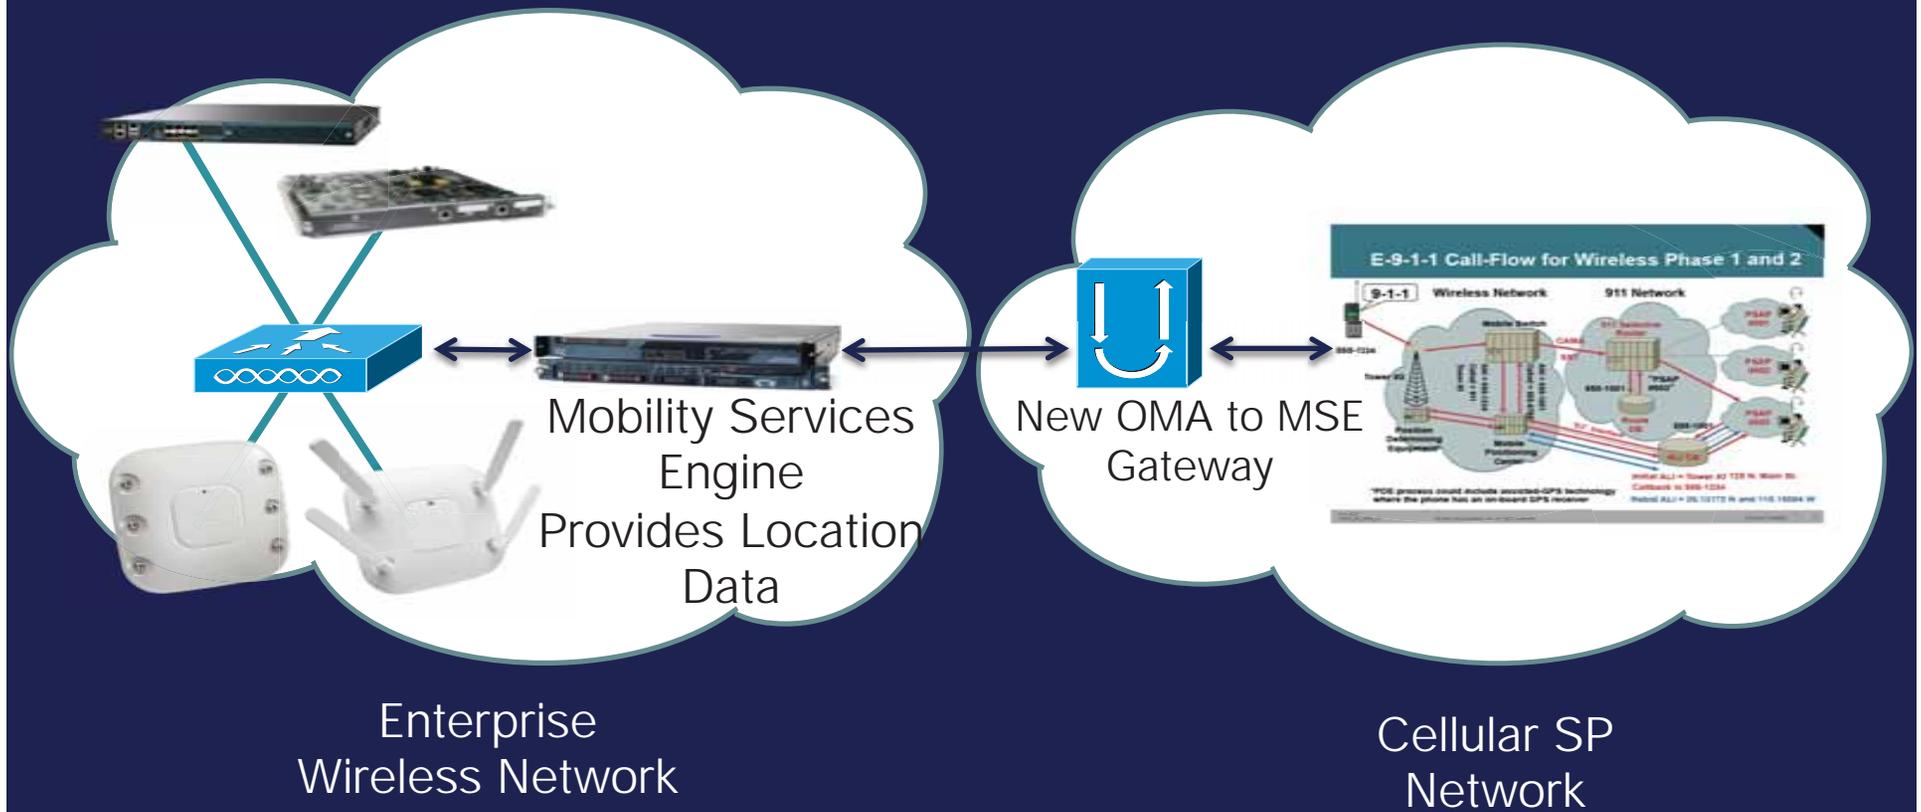

Next Generation

802.11 location – “Connect the Dots”

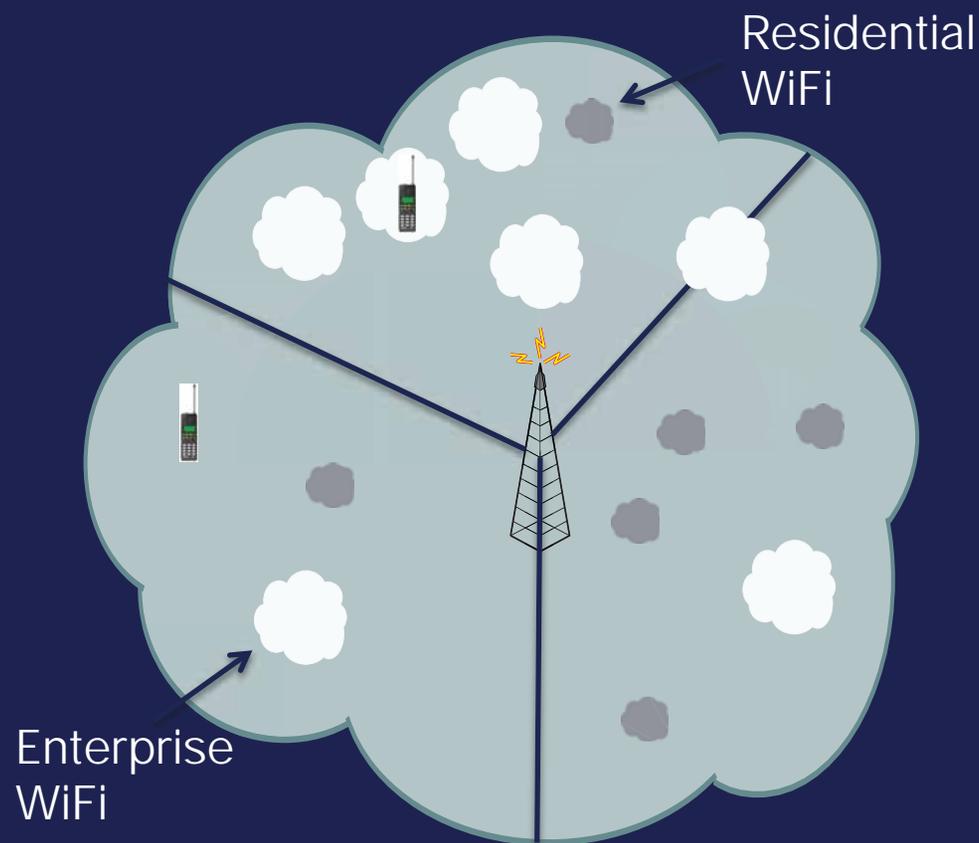

- We just need to connect the existing Enterprise Wi-Fi to the cellular location infrastructure
 - Needs to be done **securely**
 - We know how to do that!
 - Enterprises need assurance this is **only for emergency calling**
 - We know how to do that!
 - PS need assurance 802.11 location is **trustworthy and accurate**
 - Enterprises deploying LA networks do so for their own benefit
 - Enterprises manage and maintain their location infrastructure as it's \$\$ to them.
- **No new hardware – uses existing devices and infrastructure**

Enterprise Owned/Operated Location Aware Infrastructure

How does it work?

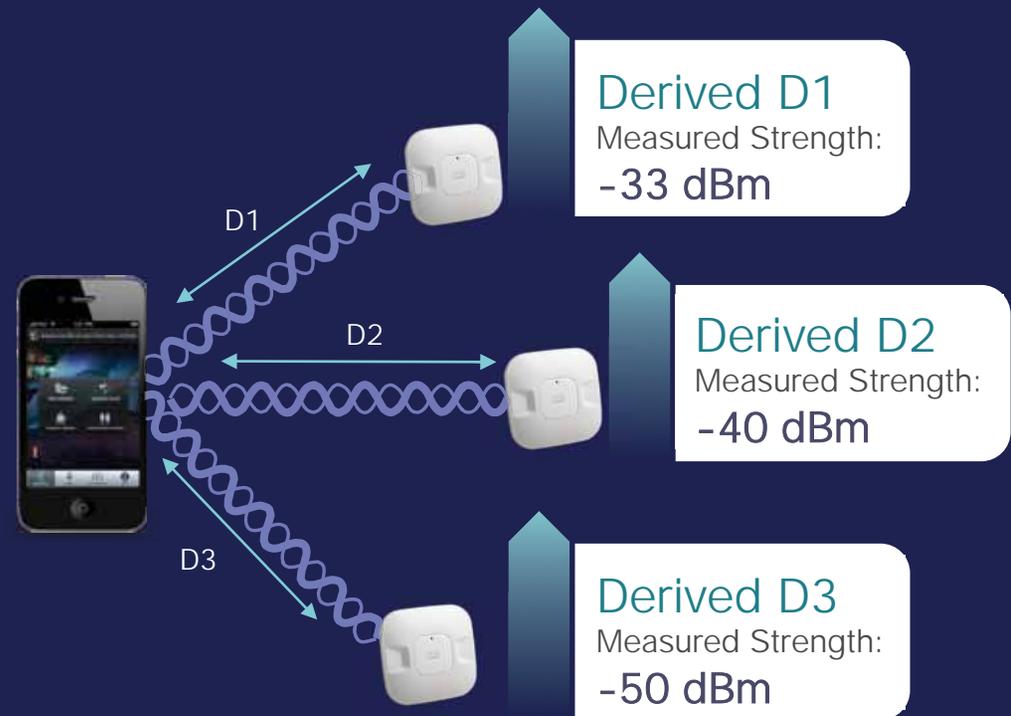

- Cellular 9-1-1 calls are routed based on cell sector
 - A PSAP assigned to each sector
- Overlay the enterprise WLAN coverage on the sector polygon
- Send to each enterprise, *"do you see this device?"*
 - Very fast query
 - Scalable to hundreds
- If you get a positive response, query further for accurate location and floor plans/map.

How Location Is Calculated with FastLocate

Higher Scalability: Device Probing and Data Packets

- Access points detect mobile devices or tag signals and measure received signal strength indication (RSSI) from all frames sent over Wi-Fi.
- Controllers send RSSI information signal to the MSE for location calculation.
- RF fingerprinting and triangulation, based on signal strengths, are used to calculate device location.

This Merits a Collaborative Approach

- Need to bring together 'all' the players
 - Cellular Service Providers
 - System Service Providers
 - Enterprises
 - Wi-Fi Equipment Providers
 - Smartphone Vendors
 - Public Safety
 - Government

Next Steps

FCC

- Don't foreclose this approach with a different decision
- Allow dispatchable location to count toward compliance
- Explore need for enterprise network-specific public safety requirements

Industry

- Technical Special Interest Group
 - Requirements gathering
 - Standardization
- Standardize public safety interfaces for dispatchable location
- Policy Special Interest Group
 - Collaborative process to examine policy framework

Thank you.

Veracity of location data received

- Public Safety is nervous about using device OS derived location
 - Can be spoofed
- The trustworthiness of location data follows a hierarchy, most to least trusted:
 - SP Network determined location
 - Including on-device GPS
 - Enterprise Network determined location
 - Crowd-Sourced Location
 - Google
 - BB SP determined location
 - End device OS-based location determination
