I have grown up alongside the Internet and thus feel responsible and linked to it. As many people, I find it's openness and freedom perhaps its most valuable characteristic. It resonates Ben Franklin's comments in the modern day that those who desire security at the sake of conceding freedom deserve neither freedom nor security. Allowing the creation of a fast lane for data will not amount to inequity in the present but in the long term will definitely create it and favor established entities in the provision of their services while hobbling smaller start ups. Given the context that many parts of our nation have also outright outlawed the creation of municipal fiber networks this is all the more true as there is no alternative to the large telecommunication firms. I know that the current arrangement of the telecommunications market amounts to an oligopoly, but it is in effect a set of regional monopolies. As a New York City resident, my only option is Time Warner, but I understand why, given infrastructure constraints competition regionally is problematic. Though perhaps this is an indication that internet and data service overall is truly a public utility more than it is a business and should be managed as such. In summation, please do not allow for the introduction of further inequity through the creation of these fast lanes, either a rising tide should raise all ships or if the fast lanes are ultimately necessary then actions should be taken to ensure that internet service is otherwise freed from its regional monopolies, whether through promulgating permitted rates that can be obtained for given data speeds or freeing the creation of municipal fiber networks. Thank you.
