Net neutrality or open internet should only refer to indiscriminating speed to everyone, just as electricity. And as electricity, internet also belongs to public utility, and it also should charge users based on the quantity of usage. Imagine that if electricity is charged at a fixed monthly rate on everyone regardless of how much one uses, people would waste a lot of energy, we would have run out of resources now, and the fixed monthly electricity bill would be rocket high for everyone. That is exactly what internet providers like Verizon are doing today. Unlimited use allows people to download garbage and stream videos and movies all day. It slows down the whole network and waste energy and resources. It makes everyone pay a rocket high monthly internet subscription bill and squeezes out resource that would have been spent on more useful things. I suggest the FCC to urge internet providers to charge internet subscription base on the amount of data a subscriber transfers.
