

In the matter of Filing RM-11737:

This would allow the petitioner to block the public access to legal, essential, secure, and reliable Internet services in order to charge for slower, less reliable, less secure service, thus giving the petitioner a monopoly on providing the lower-quality service.

2.4Ghz and 5Ghz frequencies used for WIFI, fall in the 13cm and 5cm Amateur Radio Service Bands. This request would allow malicious interference by the petitioners and as such violates FCC rules and should not be allowed.
