I would like to express my complete disapproval of any proposal to let Marriott and other businesses Balkanize our free and open WiFi bandwidths. Legitimizing sending of deauthentication packets over WiFi is legitimizing hacking of users devices and sets a really dangerous precedent. Before we know it all kinds of entities will be doing this and WiFi networks all over will be under "attack" like this massively reducing if not destroying the utility of this very valuable public resource that has brought massive benefit to consumers and businesses alike.

Across the world other entities and private individuals manage to use WiFi without resorting to such tactics which as I mentioned are tantamount to hacking. If there are bandwidth sharing issues to be resolved they must be done by open standards bodies to reach solutions that are fair to everyone and not just for whoever has the strongest signal to block other users from accessing the Internet.

Throughout history our airwaves have not been bounded by private space - we should not allow blocking of them for any reason other than public safety (airplanes etc.) In particular the unlicensed spectrum is a true and free commons that should not be devalued in this way. I strongly urge you to reject this request by Marriott.

Thank you!
