I am in favor of the proposed 250 watt increase for LPFM. My reasons are: Although most people can listen in cars within the 60 dbu, there is trouble getting into many homes (Mobles). This increase would make it easier to penetrate these structures. Also, we do get interference from higher power stations. We believe that although this may not totally fix the problem, it would help a lot.

Most LPFM stations make a very significant investment in both money and time to run and put a station on the air. It would be in the best interest of the LPFM service if we had a more reliable signal for listeners.
