Increasing the current limit of 100W to 250W would reduce the number and need for translators. Reducing translator needs would reduce channel requirements and allow more available spectrum.

Our local LPFM station covers about 8 miles very well and is a fringe signal out to about 16 miles. This covers about 80 percent of our county population. Increasing the power to 250W would allow inclusion of an additional 10-15% of the population with our community service.

In the end, it is all about inclusion of the community with LPFM. Increasing the power from 100 to 250W is a small change with BIG results for our community.
