What a Marvelous, Increasing the current limit of 100W to 250W would reduce the number and need for translators. Reducing translator needs would reduce channel requirements and allow more available spectrum.

Our local LPFM station will cover about 7 miles very well and about 14 miles is fringe signal. Increasing the power to 250W would allow inclusion of an additional people who are living in the country side or outskirts of the city, and most of those folks are surrounded by trees that mean we need more power the 250w to reach out the whole community that we are serving.

Even if it requires us to change the Freq or start from the scratch it'll worth the sacrifice.
