I come here with a simple request: don't let them take my POTS line anyway.

TDM networking technologies continue to surpass IP technologies for voice in both performance and reliability by a considerable margin. The delivery medium is inconsequential to me; fiber, copper, microwave, wet string, whatever. It's discontinuance would mark the end to one of the most simple, yet powerful networking technologies we have at our disposal.

We've seen providers such as BT in the UK or Bell Canada transition their data networks to IP, and continue to operate their TDM phone equipment without any complaints. I would hope we can follow their example, and retain the best of both worlds on our own soil.

Thank you.
