I live in rural southern middle Tennessee. Ever since early 2012, I have been trying to get some kind of internet service. AT&T, according to the National Broadband Map is supposed to have DSL for my address. The last time I submitted a request for service to them they said even though DSL was available for my address they had no open ports. (Whatever that means) I found a used 50 ft tower I'm going to try to get WIFI service but with the hills and distance, it does not look promising. I currently have Sat service with Hugesnet but with a cap of 250 meg per day it's beginning to be almost the same as dialup. With that cap and all of the web sites pushing out advertisements that include videos and other content that I don't need, my usable part of my cap is next to nothing. I see where cities and larger areas are going from 3 to 4 meg broadband to Gig broadband while folks in rural areas still have nothing. As these areas increase in speed, the content of advertising and added content are going to increase even more making my current internet useless. I don't know what incentives need to be put in place to help rural areas but we are hurting. Day by day more and more things are requiring a faster internet connection and millions of people don't have it.
