Absolutely not. CW portions are small enough now considering the sharing with data transmission, additionally the little bandwidth gained from the loss of the CW portions added to what is already available would do little to nothing to improve conditions already existing on the phone portions of the bands. Resulting in all loss everywhere and zero gain anywhere.

CW is important to have and to practice in the event of emergency where computers, phones and internet are unavailable, which conditions frequently prevail during emergency situations of most sorts. Attempting to negotiate around phone operators would make CW impossible.
