

The West Virginia Department of Agriculture oversees black-fly suppression treatments applied by helicopter to the New, Greenbrier and Bluestone Rivers. It is critical that the Coordinator of this program have access to real-time USGS river-gauge data. Without this data, it is impossible to determine the correct dosages of product (VectoBac) to apply at the treatment sites. The Black Fly Control Program is entirely dependent on USGS river-gauge access. It is vital that there be no interruption in this access. Thank you.
