

I am not wealthy. I do not head a large broadcasting company. I have been in broadcasting throughout the 90's in both television and radio, from broadcasting to engineering. I can maintain and run broadcast and transmitter equipment better than most full power license holders that I have been around, who know all about making money, but little about FCC compliance.

I am in favor of low powered FM licensing and feel that the community's ability to support it commercially, or the licensee's decision to go commercial, should not be an issue. There are communities that would gladly support a local low powered FM venture, whether it be licensed and operated by a local business, individual or charitable organization.

I believe that the small businessman, or entrepreneur will find a way to make it a profitable undertaking, just as the local church or school would find it to be inspiring, informative or just plain fun.

All of these people and groups should have the same opportunity to not only serve their community in ways that they see fit, but should be able to profit, if profit is possible from it.

I read what was available, concerning low power FM placement amongst the full powered stations and agree that 2nd and 3rd adjacents should pose no interference to the full powered stations. Likewise, I feel that the separate classes of power would be beneficial, as well.

I look forward to your decision and hope that I can be amongst those low powered licensed broadcasters.

Thank you.

Gregory Crouch
