3.0 O&P-3: EDI/TAG Normal Volume Performance Test

The EDI/TAG Normal Volume Performance Test will evaluate the behavior and performance of both the EDI and TAG interfaces under “normal” YE01 projected transaction load conditions simultaneously. This test cycle will be executed by TTGs capable of submitting large volumes of flow-through pre-ordering (TAG only) and resale and UNE service request test cases in a manner consistent with the forecasted daily usage patterns and transaction mix (including error conditions) for each interface. Patterns of time within the day and patterns of days within the month will be emulated.

The normal volume forecast will be developed across BellSouth’s entire 9-state region (not simply Georgia) as described in Appendix C: Volume Analysis. The test will be executed during two 10-hour periods by modeling the expected normal daily usage pattern (e.g., the off-peak nighttime hour loads will be ignored for the test). The majority of the transactions submitted in support of this test cycle are expected to flow through BellSouth’s OSS electronically and return an error or a FOC. The following evaluation criteria will be used to address the sub-processes and functions evaluated in test O&P-3.

Sub Process	Function	Evaluation Criteria	Test Cross Reference
Submit Orders in Projected Normal Volumes	Create order transaction(s)	Availability of Interface Timeliness of Response	O&P-3-1-1

4.0 O&P-4: EDI/TAG Peak Volume Performance Test

The EDI/TAG Peak Volume Performance Test will evaluate the behavior and performance of both the EDI and TAG interfaces under "peak" YE01 projected transaction load conditions simultaneously. This test cycle will execute selected flow-through pre-ordering (TAG only) and resale and UNE service request test cases, including error conditions.

The peak volume forecast will be developed using the peak hourly load identified for the EDI/TAG Normal Volume Performance Test and replicating those transaction volumes across an 8-hour period. Alternatively, if BellSouth's normal daily usage patterns are relatively flat, a multiple may be applied to the peak hourly load and the result replicated across an 8-hour day. The methodology and calculations are discussed further in Appendix C: Volume Analysis. The following evaluation criteria will be used to address the sub-processes and functions evaluated in test O&P-4.

Sub Process	Function	Evaluation Criteria	Test Cross Reference

This analysis will focus on electronically ordered UNEs and involves the physical inspection of BellSouth's provisioning process. Real CLEC provisioning activities will be observed in order to test end-to-end provisioning process on UNE Loop orders. In addition, in order to test the full functionality of BellSouth's provisioning process, orders will be supplemented and canceled, require outside dispatch, and address customer coordination. The following evaluation criteria will be used to address the sub-processes and functions evaluated in test O&P-5.

2.0 M&R-2: ECTA Functional Test

The ECTA Functional Test will evaluate the functional elements of the trouble reporting and screening process for both telephone number assigned and circuit identified UNEs as delivered to CLECs via the ECTA interface. This test cycle will be executed by exercising a defined set of ECTA functions associated with trouble management activities against test bed accounts.

ECTA functionality will be reviewed along with the documentation addressing its use. The functional elements of trouble reporting and screening that will be specifically targeted by this test include the entry and resolution of trouble reports, the query and receipt of status reports, access to test capabilities and error conditions. The ECTA Functional Test will be conducted against BellSouth's production environment system. The ECTA Normal Volume Performance Test will evaluate the behavior and performance of the ECTA interface under “normal” YE01 projected transaction load conditions. This test cycle will be executed by a test transaction generator capable of submitting large volumes of resale services and UNE trouble test cases in a manner consistent with ECTA’s current and forecasted daily usage patterns and transaction mix, including error conditions. The following evaluation criteria will be used to address the sub-processes and functions evaluated in test M&R-3.

4.0 M&R-4: ECTA Peak Volume Performance Test

The ECTA Peak Volume Performance Test will evaluate the behavior and performance of the ECTA interface under peak YE01 projected transaction load conditions. This test cycle will be run following the execution of the ECTA Normal Volume Performance Test (M&R-3) and will utilize a selected sample of resale services and UNE trouble test cases, including error conditions.

The peak volume forecast will be developed using the peak hourly load identified for the ECTA Normal Volume Performance Test and replicating those transaction volumes across an 8-hour period. Alternatively, if BellSouth's normal daily usage patterns are relatively flat, a multiple may be applied to the peak hourly load and the result replicated across an 8-hour day. The methodology and calculations are discussed further in Appendix C: Volume Analysis. The following evaluation criteria will be used to address the sub-processes and functions evaluated in test M&R-4.
