Federal Communications Commission
1919 - M Street, N.W.
Washington, D. C. 20554

This is an unofficial announcement of Commission action. Release of the full text of a Commission order constitutes official action. See MCI v. FCC, 515 F 2d 385 (D.C. Circ 1974).

February 2, 1999

FCC RELEASES NEW TELEPHONE PENETRATION REPORT

The FCC today released a report presenting data on telephone penetration levels by state for various income categories. It is designed to help evaluate the degree of success of making telephone service available to low-income households in each state.

To help evaluate the effectiveness of the Commission's lifeline program on telephone penetration, the report compares penetration rates for states with and without lifeline programs. Penetration increases have been greater on average in states with lifeline programs than in states without lifeline programs, both for all households and for low-income households. Between March 1984 and March 1998, the overall average penetration rate for states with lifeline programs increased by 2.6%, which was statistically significant. The increase for states without programs was only 0.9%, which was not statistically significant. For households with incomes under \$10,000 (expressed in 1984 dollars), which would be the households primarily affected by the lifeline programs, the average increase was 6.3%, again statistically significant, for states with programs versus 2.5%, again not statistically significant, for states without programs.

This report is part of a series of supplemental reports on telephone penetration that are designed to complement the information available in "Telephone Subscribership in the United States," which is published three times a year. Like the subscribership report, this report is based on data from the Current Population Survey, which is conducted by the Bureau of the Census.

This report is available in the Common Carrier Bureau's public reference room, 2000 M Street, NW, Room 575, Washington, DC. Copies may be purchased by calling International Transcription Service at (202) 857-3800. This report can be downloaded [file name: PNTRIS98.ZIP or PNTRIS98.PDF] from the **FCC-State Link** internet site, which can be reached at <http://www.fcc.gov/ccb/stats> on the World Wide Web. The report can also be downloaded from the **FCC-State Link** computer bulletin board system at (202) 418-0241.

For further information, contact Alexander Belinfante at (202) 418-0944.

TELEPHONE PENETRATION BY INCOME BY STATE

(Data Through 1998)

ALEXANDER BELINFANTE

Industry Analysis Division
Common Carrier Bureau
Federal Communications Commission

Released: February 1999

This report is available for reference in the Common Carrier Bureau's Public Reference Room, 2000 M Street NW, Room 575, Washington, DC. Copies may be purchased by calling International Transcription Service, Inc. at (202) 857-3800. The report can be downloaded [file name: PNTRIS98.ZIP or PNTRIS98.PDF] from the FCC-State Link internet site, which can be reached at <http://www.fcc.gov/ccb/stats> on the World Wide Web. The report can also be downloaded from the FCC-State Link computer bulletin board system at (202) 418-0241.

This report presents data on telephone penetration levels by state for various income categories. It is designed to help evaluate the degree of success of making telephone service available to low income households in each state. This report is updated annually.

To help evaluate the effect of the Federal Communications Commission's (Commission) lifeline program on telephone penetration, Table 1 compares penetration rates for states with and without lifeline programs.¹ As can be seen in the table, penetration increases have been greater on average in states with lifeline programs than in states without lifeline programs,² both for all households and for low-income households. Between March 1984 and March 1998, the overall average penetration rate for states with lifeline programs increased by 2.6%, which was statistically significant.³ The increase for states without programs was 0.9%, which was not statistically significant. For households with incomes under \$10,000 (expressed in 1984 dollars), which would be the households primarily affected by the lifeline programs, the average increase was 6.3% for states with programs, again statistically significant, versus 2.5% for states without programs, again not statistically significant.

This report is part of a series of supplemental reports on telephone penetration that are designed to complement the information available in "Telephone Subscribership in the United States" (subscribership report), which is published three times a year. Like the subscribership report, this report is based on data from the Current Population Survey (CPS), conducted by the Bureau of the Census (Census). Under contract with the Commission, the Census includes in the CPS questions about telephone availability in United States households and provides the Commission with summary tables on telephone penetration rates, which are used in the subscribership reports. The Census later provides the Commission with the raw CPS data files containing all of the responses to all of the questions on the CPS questionnaires. This report is designed to make available more detailed information that can be gleaned from the raw data.

The number and percentage of households that have telephone service represent the most basic measures of the extent of universal service. Continuing analysis of telephone penetration statistics allows us to examine the effects of Commission actions on households' decisions to maintain, acquire, or drop telephone service.

-
- 1 States are identified as having a program if Table 2.5 in the December 1998 Monitoring Report, CC Docket No. 98-202, p. 2-118, shows any lifeline subscribers for 1997. In 1998, the lifeline program was expanded to all states. However, the subscribership data being analyzed for March 1998 was probably too close to the implementation date of that change in the program to expect any impact to be apparent.
 - 2 The averages for the two groups of states were computed as weighted averages of the states in the groups, using the total number of households in each state as weights.
 - 3 See the last paragraph below for a discussion of the determination of the statistical significance of a change over time. The critical value is dependent on the sizes of the samples from which the change is computed.

The most widely used measure of telephone availability is the percentage of households with telephone service -- sometimes called a measure of telephone subscribership "penetration." Prior to the 1980s, precise measurements of telephone subscribership received little attention. Traditionally, telephone penetration was measured by dividing the number of residential telephone lines by the number of households. Measures of penetration based on the number of residential lines, however, became subject to a large margin of error as more households added second telephone lines and more consumers acquired second homes. By 1980, the traditional penetration measure (residential lines divided by the number of households) reached 96%, while the number of households reporting that they had telephones in the 1980 census was 92.9%.

Recognizing the need for precise periodic measurements of subscribership, the Commission requested that Census include questions on telephones as part of the CPS, which monitors demographic trends between the decennial censuses. This survey is a staggered panel survey in which the people residing at particular addresses are included for four consecutive months in one year and the same four months in the following year. Use of the CPS has several advantages: it is conducted every month by an independent and expert agency, the sample is large, and the questions are consistent. Thus, changes in the results can be compared over time with a reasonable degree of confidence.

The specific question asked in the CPS is: "Is there a telephone in this house/apartment?" If the answer to this question is "yes," the household is counted as having a telephone in the housing unit. Although the survey is conducted every month, not all questions are asked every month. The telephone question is asked once every four months, in the month that a household is first included in the sample and in the month that the household re-enters the sample a year later. Since the sample is staggered, the reported information for any given month actually reflects responses over the preceding four months. Aggregated summaries of the responses are reported to the Commission, based on the surveys conducted through March, July, and November of each year. These form the basis of our subscribership reports.

Once a year, in March, the CPS augments its sample with about 2,500 additional Hispanic households, and supplements its survey with additional questions, which seek detailed information about income. The responses from the additional Hispanic households are not included in the summary tables used in the subscribership reports. Thus, in some cases, there may be small discrepancies between the percentages in the subscribership report and those presented in this report. In the July and November surveys, only broad income categories are reported. (These are the categories that appear in the subscribership reports.)

The more detailed information from the March surveys makes it possible to adjust the income categories for inflation. The relative levels of the March Consumer Price Index for all items (as reported in Table 7.4 of the Monitoring Report) were used to make the inflation adjustment. Thus, for example, \$10,000 in March 1984 dollars had the same purchasing power as \$15,809 in March 1998 dollars. The precise current dollar values in each year are reported at the end of Table 2.

Data are presented here for the following income categories (expressed in March 1984 dollars): \$9,999 or less; \$10,000 - \$19,999; \$20,000 - \$29,999; \$30,000 - \$39,999; and \$40,000 or more. These categories were chosen because they are of approximately equal size, both in terms of income ranges and the number of households in each category. The current report uses only five categories because the small sample sizes caused by a larger number of categories would result in unreliably large sampling variability for some states.

Chart 1 shows the telephone penetration rates over time for each income category for the total United States. (The data are included in Table 2.) As can be seen from the chart, most income categories have experienced increases in penetration over time, with the largest increases being in the lowest income categories. The changes between 1984 and 1998 are statistically significant for the two lowest income categories and for all households, but not for the three highest income categories.⁴ Not all of the increases in the national total penetration rate can be explained by increases in real income, because real income increases are reflected in the movement of households between categories. Thus, penetration changes within each income category represent changes holding real income constant.

Table 2 shows the penetration rates for each income category for each state for each year. These are calculated as the ratio of the estimated number of households with telephone service, shown in Table 3, to the estimated total number of households, shown in Table 4. Table 5 shows the sample sizes on which these estimates are based.

The CPS data are based on a nationwide sample of about 50,000 households. Because a sample is used, the estimates are subject to sampling error. For the nationwide totals, changes in telephone penetration between reports of nonconsecutive years of less than or equal to 0.5% may be due to sampling error and cannot be regarded as statistically significant. As explained below, when comparing the same month in two consecutive years, changes of less than or equal to 0.4% are not statistically significant. For individual states or other subgroups of the U.S. population, the amount of sampling variability is much greater.

Table 6 presents critical values for determining whether changes in penetration for the state totals in nonconsecutive years are statistically significant (at the 95% confidence level). Because there is an overlap of half of the sample from year to year, but no overlap in the sample between surveys in nonconsecutive years, annual changes are less subject to variations in sampling error. Consequently, the critical values should be multiplied by 0.8 when making a comparison for the same month in two consecutive years. For individual income categories, the critical values are larger because the sample sizes are smaller. The sampling variability is inversely related to the square root of the sample size. The critical values for individual income categories can therefore be estimated by taking the critical value for the state total and multiplying it by the square root of the ratio of the sample size for the state total to the sample size for the income category. In most cases the critical value for an individual income category

4 See footnote 5 for the critical values for these significance tests.

will be between two and three times the critical value for the state total.⁵ In some cases these critical values are very large because the sample sizes are very small for these subcategories, thereby rendering the estimated penetration rates unreliable.

5 For example, using this methodology to calculate critical values for comparing the 1984 and 1997 values for the United States total, the critical values are 1.1% for the \$9,999 or less and the \$10,000 - \$19,999 categories, 1.2% for the \$20,000 - \$29,999 and the \$40,000 or more categories, and 1.5% for the \$30,000 - \$39,999 category. These compare with 0.5% for all households.

TABLE 1 - COMPARISON OF PENETRATION RATES FOR STATES WITH AND WITHOUT LIFELINE PROGRAMS
