

5.3.5 Assignment of Control

In a disaster situation, the use of one or more Tactical Channels may be dedicated by the local Network Control Center to a specific function determined necessary for management of the immediate situation. Dedicated assignment of Mutual Aid Channels is subject to the approval of the local Emergency Operations Center, the State of Florida Division of Emergency Management of the Department of Community Affairs, State of Florida Department of Law Enforcement, or State Technology Office, as determined by Statutory authority.²⁷

When a state of emergency is declared by the Governor under the provisions of the statutes referenced in the foregoing footnote, the State of Florida may take over the Calling Channel and Tac 1 for State law enforcement operations and act as a temporary Network Control Center for the duration of the declared emergency.

5.3.6 Technical Limitations on Mutual Aid Channels

A. Encryption

Transmissions on the Calling Channel shall not use any means of encryption or other selective signaling techniques.

Due to the nature of communications on the four Tactical Channels, the ability to operate securely on these channels would both protect and enhance such operations in some circumstances. Since there is no common standard for encryption among manufacturers however, this Plan does not require that any equipment on the four tactical channels be capable or otherwise equipped for secure speech communications. Those agencies who do require secure voice interoperability with other agencies outside their normal channel operations will be expected to provide the compatible equipment necessary for their mutual needs, but such that non-encrypted communications from either fixed or mobile stations of other agencies are not restricted.

During a disaster situation, communications on the Mutual Aid Channels designated for disaster relief operations shall not be encrypted.

B. Telephone Interconnect

Telephone interconnect (i.e., telephone patching) shall not be allowed on any of the Mutual Aid Channels. Telephone interconnect seizes the channel for the duration of the telephone call and tends to be more lengthy than typical radio traffic. Therefore, prohibiting telephone interconnect maintains the channel capacity of these channels.

C. Radio Cross-Patching

Cross-Patching shall not be allowed on any of the Mutual Aid Channels; except, in accordance with Sections 5.3.4 and 5.3.5 for disaster situations. Cross-patching uses up to twice the channel bandwidth for a single communications exchange and undermines the intent of true interoperability, regardless of whose channels are used (Federal, State, or Local). Therefore, prohibiting radio cross-patching maintains the channel efficiency of these channels.

²⁷ Florida Statutes, Chapter 252, entitled "Emergency Management" defines the emergency management powers and duties of the State and political subdivisions. Florida Statutes, Chapter 23, entitled "Florida Mutual Aid Act" establishes the administration of the Florida Mutual Aid Plan by the Florida Department of Law Enforcement.

5.3.7 Mutual Aid Channel Equipment Requirements

- A. All mobile and portable radios shall be equipped to operate on all five Mutual Aid Channels.
- B. All fixed and mobile/portable equipment operating on the Mutual Aid Channels shall use continuous tone-controlled squelch (CTCSS) tone of 156.7 Hz.
- C. Base stations shall be equipped to operate as mobile-relay stations (repeaters) but shall normally operate in the repeat-disable mode until a request for mobile-relay service is received. Each Network Control Center shall be equipped to control the repeat-enable/disable function of all Mutual Aid Channel repeaters for which it serves as the primary control center.

5.3.8 Operating Requirements

On all Mutual Aid Channels, plain ENGLISH will be used at all times; the use of unfamiliar terms, phrases, or codes is not allowed. Users will be from different agencies, each having their own procedure and protocols. Any attempt to introduce codes would cause confusion, increase risk, and possibly even rejection of the Mutual Aid Channel concept.

5.4 System Interference Protection Standards

The following standards are established to provide uniform measures of protection to all systems against co-channel and adjacent offset-channel interference, as well as to limit powers and antenna heights to provide for maximum re-use of channels.

Distances between co-channel base stations will not be held to seventy (70) miles or any other fixed value. Separation of co-channel and offset-channel stations will be determined analytically using the protection ratio methods defined in this Plan. Analytical modeling of system interference in the Florida Region shall utilize the center-band frequency of 838 MHz as the standard frequency for analysis.

Predictions of the following coverage and interference contours shall utilize the *horizontal* gain of antennas (including "downtilt" antennas).

These interference protection standards shall not apply to stations on the Mutual Aid Channels. The design and implementation of Mutual Aid Channel systems shall be approved on a case-by-case basis.

5.4.1 Protected Service Area Contour

The Protected Service Area Contour (PSAC) is limited to no more than three (3) miles outside the boundary of the user's legal jurisdiction. The median field strength at this contour, as determined by the methods stated in Section 5.4.5, shall not exceed +40 dBu (4.75 uv across 50 ohms at 838 MHz). In order to allow for practical system design, the 3-mile pad may be altered when approved on a case-by-case basis, provided that the change does not exceed the interference protection criteria to other existing systems or allotted channels. The Protected Service Area Contour further than 3 miles beyond the bounds of a jurisdictional area of concern cannot be tolerated unless it is critical to the protection of life and property and can be so demonstrated.

Systems of four (4) or fewer channels operating in the conventional mode that do not meet FCC loading standards may be required to share the channels on a non-exclusive basis. For these systems, the Protected

Service Area Contour shall not be protected from the Co-Channel Interference Contour of other systems, although they shall be protected from other Offset-Channel Interference Contours.

5.4.2 Co-Channel Interference Contour

The Co-Channel Interference Contour (CCIC) is defined as the +14.4 dBu contour as determined by the methods stated in Section 5.4.5. The Co-Channel Interference Contour of undesired stations shall not intersect the Protected Service Area Contour of desired stations. This standard will provide at least a 25.6 dB ratio of protection to and from mobile stations on or within a Protected Service Area Contour.

5.4.3 Offset-Channel Interference Contour

The adjacent Offset-Channel Interference Contour (OCIC) is defined as the +33.3 dBu contour as determined by the methods stated in Section 5.4.5. The Offset-Channel Interference Contour of undesired stations shall not intersect the Protected Service Area Contour of desired stations. When combined with the 20 dB receiver selectivity requirement of Section 5.2.2, this standard will provide a 26.7 dB ratio of protection to and from mobile stations on or within a Protected Service Area Contour.

5.4.4 Limitations on Power and Antenna Height

- A. Systems Having a Protected Service Area Contour Radius of 21 miles (34 km) or More - The effective radiated power (ERP) and antenna height for base stations shall be no greater than 500 watts (+27 dBu) and 500 feet (152 meters) above the Composite Average Terrain (see Section 6.2.2.B on page 6-4) respectively. These are maximum values, and applicants are required to provide adequate justification for the actual power levels and antenna heights requested.
- B. Systems Having a Protected Service Area Contour Radius of Less than 21 miles (34 km) - The effective radiated power (ERP) and antenna height for base stations shall be limited to the values shown in Table IV. Values between those shown on the table may be estimated by interpolation, however the method described in Section 5.4.5 will yield more accurate results.

Table IV - Effective Radiated Power Limits For Systems Having Less than a 21-mile (34km) Protected Service Area Contour Radius

PROTECTED SERVICE AREA RADIUS mi (km)	BASE STATION ANTENNA HEIGHT (AAT) (feet)										
	50	75	100	150	200	250	300	350	400	450	500
21 (34)	500	500	500	500	500	500	500	500	500	500	500
20 (32)	500	500	500	500	500	500	500	500	500	484	369

8 (13)	500	500	294	141	72	43	30	23	19	15	12
7 (11)	500	357	192	93	47	28	20	15	13	10	8
6 (10)	500	221	122	59	30	18	13	10	8	7	6
5 (8) or less	262	115	67	34	18	11	8	6	5	4	4

5.4.5 Coverage and Interference Model to be Used

The signal contour model to be used to determine compliance with the interference protection standards of this Plan is a computer version of the Okumura model prepared by the Florida Bureau of Wireless Communications, and which is available upon request by applicants (see address on page 6-1) or via the Internet at <http://www.techplan.state.fl.us>. The computer model (referred to as the "Florida Region Interference Program") predicts Protected Service Area Contours, Co-Channel and Offset-Channel Interference Contours, distance and azimuth between stations, and computes the applicable desired-to-undesired signal strength ratios. The computer program may be used on any IBM-compatible personal computer having a draft or better quality printer. The Florida Region Interference Program has been verified to closely correlate with the Motorola version used in the initial channel allotment process (see Section 4.4, page 4-1).

The Florida Region Interference Program was prepared as an interference model only, and *is not intended for the design of systems*. The program does not include many variables which are necessary for the detailed engineering and tailoring of individual system designs.

For the purposes of portable "talkaround-only" systems, the portable radio transmitter parameters shall be utilized in the Florida Region Interference Program to protect existing primary allotments and determine the acceptable area of operation. Until the Florida Region Interference Program is modified to perform this specific analysis in a user-friendly manner, the State of Florida, Bureau of Wireless Communications will perform this function.

5.4.6 Radio Frequency Control Stations

Radio frequency control stations shall operate on a "secondary basis" to primary stations (i.e., base or mobile-relay, mobile, or portable radio). Radio frequency control stations shall employ directional antennas having a front-to-back gain ratio of at least 10 dB. Radio frequency control stations shall be engineered to provide no more than -98 dBm rf signal level at the base station receive antenna terminals. Any approval for operation of RF control stations shall have the stipulation that *these stations are continually contingent upon no substantiated complaints of interference to either present or future systems* (secondary basis). Upon the Florida Region Committee's confirmation of any such complaints, operation of such RF control stations shall be modified to mitigate the interference or discontinued if a cooperative agreement can not be reached between affected licensees.

Table V - Statewide Emergency/Mutual-Aid Frequencies

154.755/155.430	154.890/155.625	158.730/159.030
154.770/155.490	155.010/155.655	158.790/159.090
154.785/155.520	155.070/155.670	158.850/159.150
154.800/155.535	155.130/155.685	158.910/159.210
154.815/155.550	155.640/155.970	155.700/158.970

Transmit capability from remote stations outside the licensed area should be achieved through other means such as telephone lines, microwave, or other type of radio control.

5.5 Relinquishment of Lower Frequencies

It is anticipated that in all but the most unusual cases, frequencies presently utilized by a licensee will be relinquished for reassignment upon implementation of new systems under this Plan. Agencies shall not be permitted to attempt a direct reassignment of vacated channels, nor to "farm-down" frequencies to other services within their political structure. The need for communications by such an agency may be outweighed by the needs of another entity.

The FCC authorized frequency coordinators will be responsible for reassignment of the channels to the various eligible agencies awaiting channels in lower frequency bands. Normal coordination procedures will be followed with these turned back channels, except that recommendations made by the Region Plan Committee using the Service Category Evaluation Point values defined in this Plan (see **Table II**, page 4-3) are to be considered. In such cases where specific channels are requested by numerous applicants, the Florida Region Channel Allotment process will be utilized (see **Figure 2**, page 4-6). In all cases, area of coverage criteria and channel loading criteria as covered in this Plan will be applied.

As lower band frequencies are vacated, they will be reassigned to conform to the lists of Statewide channels as shown in Table V and Table VI in accordance with State of Florida communications plans. In each table, the base station transmit frequency is shown first, followed by the mobile transmit frequency.

5.6 Implementation Schedules

The majority of eligible public safety organizations are either of State and Local government, or else are subject to governmental regulation. The nature of governmental planning and budgeting processes, combined with difficult revenue constraints, prohibits most eligibles from implementing newer technology systems in the normal time required by FCC Rules (8 months for construction of conventional stations, 12 months for trunked stations)²⁸. In most cases, public safety systems will require multi-year phased-implementation schedules requiring three to five times as long to construct as private or commercial systems. Regional, wide-area, and statewide systems will require even longer periods to construct.

In view of these known situations, this Region Plan establishes an extended implementation schedule in accordance with FCC Rules²⁹ which is available to all eligible applicants, *if requested by stating "SLOW GROWTH" on the license application*. A **SLOW GROWTH** schedule will allow up to five years for completion of station construction. Applicants who request **SLOW GROWTH** are *not required* to submit the specific items of **SLOW GROWTH** justification normally required by FCC Rules.³⁰

END OF SECTION 5

²⁸ See FCC Rules § 90.155(a) and § 90.631(e).

²⁹ See FCC Rules § 90.629, § 90.631, and § 90.633.

³⁰ See FCC Rules § 90.629(a).

6.0 APPLICATION PROCEDURES

6.1 General Application Requirements

Applications for frequencies in the 821-824/866-869 MHz band shall be prepared and submitted in accordance with applicable FCC Rules, APCO frequency coordination procedures, as well as with requirements of the Florida Region Plan. For portable "talkaround-only" systems, applications shall comply with only Sections 6.1.1, 6.1.2, 6.1.3, 6.2.2 and 6.2.2(C). Mutual Aid-only applications shall be excluded from the requirements of sections 6.1.3(D, E, G, H, & I) and 6.2.2.

6.1.1 Where to Submit Applications

Completed applications shall be submitted to the Chairman of the Florida Region Committee or the Chairman of the Local Subregion Committee (if established) who will then review and forward applications to the Region Committee Chairman. Refer to the list of Chairmen's names and addresses in Table I, page 2-3.

Information regarding active Local Subregion Committees may be obtained from the appropriate Subregion Chairman or from the Florida Bureau of Wireless Communications. Applications received by the Region Committee which show no evidence of Subregion review (where required) shall be forwarded to the Local Subregion Committee without further action.

Following application approval by the Region Committee, a copy of the application shall be retained by the Florida Bureau of Wireless Communications. The original application will then be returned to the applicant with instructions to send the application to APCO accompanied by payment of the required fees. ***DO NOT send any payment with the initial application to the Subregion or Region Committee.***

6.1.2 Forms to be Used

Applications shall be submitted using the latest versions of FCC Form 600 "Application for Mobile Radio Service Authorization", and APCO Form FDR "Request for Frequency Data Research". In addition each application shall include all supplementary documentation and exhibits as required by this Region Plan.

Copies of the necessary forms and FCC instructions, as well as general assistance in completing applications may be obtained by written request to the CIO, State Technology Office, 4030 Esplanade Way, Tallahassee, Florida, 32399-0950.

6.1.3 Supplemental Information to be Submitted

Applications submitted shall include all of the following information. All information shall be clearly contained within 0.75 (3/4) inch margins of lettersize (8 1/2" x 11") paper, or folded to an 8 1/2" x 11" size.

- A. A Statement of Need for utilizing 821-824/866-869 MHz frequencies under the jurisdiction of this Plan.
- B. A showing that a budget commitment has been made by the jurisdiction responsible for implementation of the proposed system.

- C. A detailed schedule of implementation milestones by month and fiscal year showing estimated dates of procurement activity and system implementation including dates and quantities of mobile station implementation. If a "slow growth" construction schedule is needed, applications must clearly state the phrase "*SLOW GROWTH*" on the application Form 600 (see Section 5.6). If a station construction or loading schedule longer than that allowed by this Region Plan and FCC Rules is required, the application must include a Request for Waiver³¹ for such an additional extension of time.
- D. For conventional (non-trunked) systems, a statement explaining why the proposed system cannot or should not be on a lower band or consolidated with other systems into a more spectrum-efficient trunked system covering the same or larger geographic area.
- E. If a proposed conventional (non-trunked) channel is to be used for mobile data, automatic vehicle location, or other non-voice signaling, explain why the proposed operation cannot or should not utilize lower-band frequencies.
- F. An explanation of implementation and operational plans to establish compliance with the Mutual Aid Channel requirements of Section 5.3 of this Plan.
- G. An explanation as to how system interoperability will be achieved with other public safety and special emergency services in other bands, particularly via long distance radio communications for emergency management purposes such as amateur radio, satellite communications, and long-range emergency preparedness communications systems in accordance with Section 5.1.5 of this Plan.
- H. A copy of each FCC license for all radio frequencies and call signs, in all radio services, which are currently licensed to, or applied for by, the applicant within 40 miles (64 km) of each proposed site. This information must correlate to the plans for frequency relinquishment (or retention) in the following Section.
- I. For each existing (or applied for) frequency to be relinquished, the application must include a date upon which relinquishment is planned. For each existing (or applied for) frequency proposed to be retained, include a detailed showing of justification as to why the frequency must be retained rather than relinquished for use by other organizations.
- J. All Technical Information as required by the following Sections.

6.2 Technical Content of Applications

All applications shall contain all technical information required by the FCC and APCO application forms as well as the following information necessary to fully describe, for Protected Service Area and Interference Contour purposes, the proposed system implementation. Some of the required information is automatically generated by the "Florida Region Interference Program" (see Section 5.4.5) and is included in the program's Final Report. Applicants may submit either a printout of the Final Report with their application, or a 3.5" or 5.25" floppy disk containing the program files relating to the application. The Florida Region Interference Program contains a menu-selectable utility which will copy the necessary files to a floppy disk.

³¹ See FCC Rules, § 90.151, "Requests for waiver".

6.2.1 System Design Parameters

A. System Gains and Losses

Each application shall include a summary calculation of the system gains and losses totaling the Effective Radiated Power (ERP) of each particular antenna system in the direction of each of the eight cardinal radials (see Section 6.2.2.A.(1)), as well as in the direction of each licensed or allotted Co-Channel and Offset-Channel system.

B. Antenna System Parameters

- (1) Antenna System Vertical Profile Drawing - Each application for a new or modified antenna system shall include a vertical profile drawing showing the overall antenna structure (tower, building, or other structure) detailing the height of both the tip and center of radiation of the proposed antenna, the ground elevation, and clearly showing the overall height of any supporting building or other antenna structure. Heights shall be in terms of elevation above-mean-sea-level (AMSL), or elevation above-ground-level (AGL).
- (2) Horizontal Antenna Configuration - Each application shall include a plan-view drawing showing the antenna horizontal position relative to its supporting structure. For side-mounted antennas, clearly define the dimensions of the supporting structure (such as tower face width, tower leg diameter, etc.) as well as the relative position of the antenna and the distance (in wavelengths or feet) between the antenna and structures supporting it. Include any other data necessary to support the values shown in accordance with 6.2.1.B.(3).
- (3) Antenna Gain Patterns - For each proposed antenna, a horizontal gain pattern shall be included showing the antenna power-gain distribution throughout 360° in the horizontal plane expressed in decibels above the gain of a half-wave dipole. For "downtilt" antennas, a vertical gain pattern shall also be included showing the antenna power-gain distribution throughout 360° in the vertical plane expressed in decibels above the gain of a half-wave dipole. For side-mounted antennas, the gain patterns shall analytically or empirically take into account the size, shape and orientation of the antenna mounting structure.

6.2.2 Interference Studies

Each application shall contain interference studies demonstrating that the proposed stations will not cause harmful interference to existing or allotted co-channel or offset channel systems. Interference studies shall be prepared using the "Florida Region Interference Program" (see Section 5.4.5). This program will analyze proposed stations with respect to a database of all existing and allotted systems within Florida. Since this database is dynamically maintained, applicants are cautioned to insure that only the LATEST VERSION of the computer program is used in preparing applications.

For portable "talkaround-only" applications, a "Letter of Concurrence" from each affected primary agency will be accepted for co-channel operation in lieu of a satisfactory interference study. The letter shall be on the affected primary agency's letterhead, state concurrence for the applicant to operate on the affected agency's co-channel frequencies, list the frequencies, and be signed by the affected agency's authorized signer.

A. Terrain Profile Graphs

Each application shall contain terrain profile graphs accurately indicating topography and satisfying the following requirements, except that systems in Monroe, Dade, Collier, Broward, and Palm Beach Counties may assume an average terrain elevation of 10 feet above mean sea level; profile graphs within these counties are not required.

- (1) Cardinal Radials - Terrain profile graphs shall be drawn from the proposed station site extending to 20 miles for each 45 degrees of azimuth starting from True North.
- (2) Profile Distance Increments - The profile graph for each radial shall be plotted in uniform increments of distance and using the nearest contour interval available from topographic quadrangle maps having a scale of 1:24,000. The distance increment shall generally be not more than 1/4 mile, except that in cases of uniform or gently sloping terrain, the distance between the smallest contour on the topographic map should be used, even though relatively few points may be available. When a portion of the radial extends over water, that portion need not be included on the profile graph (or in computations of average terrain) unless the radial passes over United States land within 80 miles of the proposed station.
- (3) Profile Graph Format - Each profile graph shall be plotted on rectangular-coordinate paper or 4/3 curved-earth paper, and showing the distance in miles on the horizontal axis, and elevation in feet above mean sea level on the vertical axis. Each graph shall indicate the azimuth bearing relative to True North.
- (4) Sources of Topographic Data - Each profile graph shall indicate the source of topographic data used (name and latest revision date of quadrangle). In lieu of topographic maps, the profile elevation data, profile graphs, and computation of average terrain elevation may be computer generated from 30 arc-second or better terrain databases. The database used shall be clearly identified, and the data shall be processed for intermediate point values using an interpolation technique of at least linear accuracy. For determination of the height above mean sea level of the antenna site, as well as in cases of dispute, the most current U.S.G.S. 1:24,000 topographic data shall be used.

B. Calculations of Average Terrain Elevations

The average of terrain elevation values above mean sea level for elevation points between two and ten miles for each of the eight cardinal radials shall be shown in the application, and shall be further averaged to produce a value for the Composite Average Terrain Elevation. The composite value determined shall be used for determination of the antenna height above average terrain (HAAT) which shall be entered on FCC Form 600, item G7.

Calculations of potential interstation interference shall use an antenna height above average terrain based on an average terrain elevation along the interstation radial obtained by cubic spline of the average terrain elevations of the 8 cardinal radials. The Florida Region Interference Program performs these calculations automatically.

C. Interference Calculations

For each pair of base stations studied (proposed and co-channel or adjacent offset-channel), the Florida Region Interference Program shall be used to determine:

- (1) The distance in miles and radial bearing in degrees relative to True North between the proposed station and the co-channel (or offset-channel) station.
- (2) The distance in miles from the proposed station to its Protected Service Area Contour (PSAC).
- (3) The distance in miles from the co-channel (or offset-channel) station to its PSAC.
- (4) The distance in miles from the proposed station to the PSAC of the co-channel (or offset-channel) station.
- (5) The distance from the co-channel (or offset-channel) station to the PSAC of the proposed station.
- (6) For the point of intersection of the interstation radial and each PSAC:
 - (a) The field strength of the undesired signal in dBu.
 - (b) The ratio (in decibels) of the desired and undesired field strengths.

D. Protected Service Area Contour Drawings

Each application shall include a map (or maps) showing the boundaries of the applicant's legal jurisdiction and the complete +40 dBu contour of the proposed station (or stations). Maps used for these drawings shall not be of greater scale than 1:500,000. Copy reduction is allowed provided the resulting scale is clearly indicated. As provided in Section 5.4, calculations involving a "downtilt" antenna shall utilize the antenna's *horizontal* gain for prediction of the contour.
