

I support RM-10352, as a frequent user of the 160 meter amateur radio band. I normally use continuous wave telegraphy on 160 meters and I am seriously contemplating using PSK31, MFSK16, and other digital modes there in the near future. I have encountered interference from wide band modes on 160 meters which made it difficult or impossible to continue my radio contact. Adoption of RM-10352 will greatly reduce interference for the users of BOTH wide band and narrow band modes on the 160 meter band, and further enhance the popularity of this amateur radio band.
