

I believe it is in the public interest, given the changing requirements of the ham radio population over the years - to retain an unstructured 160 meter band, and not force an overly divisive band plan on the last remaining ham band where gentlemen's agreements between modes and segments have always prevailed.

The US remains almost alone in having subbands in force on various amateur bands. It would be a shame to port these artificial requirements over to 160 meters.

Respectfully submitted,

Y. A. Feder

W1UX (licensed since 1953, and a long time user of the 160 meter band.)
