

I own a small company in Franklinton, la., pop. 4500, that provides broadband access to local business's via unlicensed wireless equipment. My biggest problem in delivering broadband wirelessly is LOS (Line Of Sight). If more freq. spectrum was made available, especially in the lower bands such as 700mhz i could provide affordable, dependable wireless broadband to everyone in the communitiy without trying to shoot over the trees.

Thanks for listening
