

BPI is such a bad idea and such bad technology, I can't believe that any technical agency like the FCC would EVER consider it. You need to look at spectrum allocation as it now exists and then do an analytical analysis of what BPL is going to do to it. If you don't have engineers who can perform this task, then you are failing the mandate that congress has given you. Again, BPL is a very bad idea using very bad technology that will profit companies that do not have the technical resources or capital to utilize modern technology. It would do much harm to the radio frequency spectrum and might damage the services that now use it to the point where human lives are lost.
