

Broad band over power is not a new idea. It has failed in other countries. Allowing this technology to become wide spread would virtually strip the amateur community of it's privilege to operate the HF bands. The FCC is empowered to make effective use of the limited spectrum we have. What BPL would cause is the equivalent to radio spectrum pollution. The negative effects would be much greater than expected. Simple devices like cardiac monitors and Automatic External Defibrilators may be useless in close proximity to this type of emission. Please look forward to the future and find better ways of providing broadband access to our communities.
