

I may be excused for saying that FCC is totally misguided in separating High Speed Internet/Broadband by your Cable Company and High speed Internet/Broadband developed for delivery over the Fiber Optics and choosing to invite Comments on the High speed Internet service delivered by Internet Companies alone and choosing to ignore the High speed Internet/Broadband by Fiber Optic People.

The fact is and will ever remain that the high Speed Internet/Broadband has been thoroughly rejected by the people who surf the internet. As a matter of fact the fiber Optic people are loosing all the investment Capital provided by the general public who can't even afford to invest by means of utilization of Securities Act of 1933 which allows the sale of billions of dollars worth of securities to non-accredited investors and then passing on the control of their companies to other accredited investors by passing on the assets for less than a penny for each Dollar invested by non-accredited Investors and handing over the securities owned by these non-accredited investors to these new accredited investors. These fiber optics Companies rely upon the blessings of Federal Bankruptcy Courts and the judges like his honor Judge Gould that are allowing companies after Companies like Global Crossing, World Communications, Adelphia Communications to declare bankruptcies and rob the original non-accredited investors.

Soon after emerging from Bankruptcy the new accredited investors, who acquired the securities of the bankrupt Companies, are allowed to sell their newly acquired securities back to the very investors from whom these shares were taken away for free.

Here is the point of my comments. The Thae cable Companies are in the same boat as the Fiber optic companies in that they are loosing capital from the high speed Internet operations. Only thing they are achieving is to prevent other Companies (whether fiber optic or broadband from making profit.

The reason for the failure to make a profit is not just Competition between cable and fiber optic. The reason, pure and simple, is that the fast Internet service is illusion. It is no faster than the conventional internet service delivered over the telephone lines of Telephone companies. While the delivery of data, indeed is faster, over the cable or the fiber optic when high end routers are used, the time saved is wasted by the processors utilized to surf the internet due to lack of utilization of multitasking and nano-technology.

As a matter of fact the situation is so bad that baby bells like Verizon pool their wired Broadband Internet operations with their other services and try to push these pooled services through the throats of the public by using actors to advertise the pooled services. In one ad the actors are sitting at three different tables and one actor passing across each of the tables and saying "he's using it, she is using it, they are using it, why are not you using it". The ad implies that you are foolish for not using it when the people in the Ad are using it. In another ad Verizon tells the viewers that the verizon offer is a no brainer and it's a surprise that viewers are rejecting it.

Admittedly the Cable Companies are not going bankrupt. But their broadband losses are being covered by the profits made by the cable Companies from their TV operationa and keeping the costs of offering those other services high.

These fiber optics and Cable Companies are defrauding the general public by claiming that high speed Internet service has any advantages over the Conventional Internet service. FCC is aiding and Abetting with these fiber Optic and cable Companies by asking for comments from the same companies who commit these frauds.

What is needed is not the Comments. What is needed is not the opinions of college professors who will get commissions of hundreds of millions of dollars to back up the high Speed Internet service Companies. But what is needed is the scientific determination of the time the processors of the average surfer of internet remain idle. Not just for specific tasks like downloading or burning a CD but for a varity of tasks that are preformed by the Internet surfers.

Only such an approach will rid the public of the fraud being made on the surgers of the internet, on the unaccredited investors.

There is no fraud on the accredited investors. They are given senior bonds for their investment and these bonds are redeemed by the companies for new shares of Common Stock after the companies go public and these new shares of Common Stock got traded back to the unaccredited investors.

It should be mentioned that Global crossing was required to show that it'll make a new profit when the debt is converted to stock. But the company was allowed to emerge even after the financial results of Global crossing showed losses.

Only Fcc can stop this abuse by these cable and fiber optic Companies and looking at the financial aspect of their operations and making an inquiry into why the profits are absent.
