

I would like to support the position of NYCWireless on this matter.

The proposed requirement for "professional installers" is unnecessary and counterproductive. WiFi has become a booming industry, in part because thousands of home users have installed access points in their homes and businesses. Thousands of volunteers have built hotspots in their local communities and in small businesses throughout America.

All without professional installers.

Increasing the amount of spectrum available for UNLICENSED access will further fuel economic growth, technological innovation, and the expansion of a public and civic communication infrastructure. Please weigh these arguments carefully. Although this issue has received very little attention, it may be one of the most important decisions the FCC will make for many years.

Thank you.
