

I operate a Wireless Internet Service Provider (WISP), and I would like to continue servicing our area with the highest quality internet access available in the area. It would certainly help to have spectrum set aside for WISP's so that we can offer reliable service without the worries of interference from frequency hopping phones, video surveillance systems, indoor wireless networks.

I don't have to tell you that this is a wireless world - or at least everyone wants it to be, and wireless internet needs room to grow to compete and mature in the marketplace against other technologies.

Thanks
