

As the ISM band continues to grow more noisy, I am in favor of using the 3650-3700 mhz band for unlicensed public use. As a small wireless ISP in rural Indiana, I also understand the importance of using contention based media access control. This ensures that different vendor gear will play fairly with eachother and that a particular vendor won't be able to 'trash the band' with an always on radio or something that is synchronized and uses the whole band at once when it transmits.
