

We provide wireless broadband to several small communities and rural areas of Clark County. If access to the 3650mhz bandwidth is licensed, we will not be able to offer broadband to these remote areas. Unlicensed access allows us to operate as a small business offering a higher level of customer service than larger entities. As these companies grow larger, their quality of customer service goes down giving customer incentive to choose us as their broadband provider.

WISPS, as small businesses, contribute to the diversity customers have come to expect. If we are locked out of these new frequencies, big business will have once again removed choice from the customer landscape.

I vehemently oppose closing these frequencies to small, independent internet service providers.
