

I favor amending Section 97.201(b) of FCC Rules to allow auxiliary stations to transmit on the 2 meter band above 144.5 MHz, except 145.8-146.0 MHz, in addition to the frequency segments previously authorized.

The two meter spectrum can be easily coordinated in the unlikely event that implementing this proposal should cause interference. More, allowing auxiliary operation on these frequencies will allow much greater flexibility in experimentation and in providing remote operations in support of disaster and other contingency communications.
