

WISPs do not have adequate spectrum to operate their networks as effectively as they could with television channel space. The spectrum is getting tight because of the massive growth of wireless broadband in our markets. We are also unable to cover large parts of our markets due to not having access to easy NLOS spectrum space. Us middle-class WISP owners cannot play in the auction game. We do not need a telecommunications industry made up of spectrum "haves" and "have nots". We need middle class spectrum policy. Making good spectrum available to unlicensed broadband operations is a good start and I support 04-186 as a step toward a spectrum middle-class that America so disparately needs to thrive and become the number one broadband adopting country in the world.
