

As we are a small rural Broadband Provider who competes with large corporations for spectrum. It is our industries best interest to have more affordable spectrum alternatives.

Selling every vailabel spectrum makes it difficult if not impossible for small companies, like mine to compete. Buying spectrum cost enormous amounts of money. Not to mention the cost of specialized equipment.

Opening spectrum like 700 mhz to unlicensed use will allow companies like ours to grow. End users who want broadband also benefit from more unlicensed spectrum as the industry will build more equipment for the new spectrum which will drive down the cost to homeowners.

For the small WISP to grow and continue to serve the forgotten rural subscribers more unlicensed frequency is needed. Especially the lower bands like 700mhz that can travel farther through more terrain and thus serve more rural communities.

Please open this frequency for the publics use.
