

We are a WISP in Vermont, a great deal of our customer base is in rural areas. These customers in most cases have no other options for broadband or are limited to satellite. Anything that can allow us to provide more non-line of sight access would be of tremendous benefit. Vermont is fairly hilly and with many trees so line of sight can be a severe limit to some people who would otherwise love to sign up for our service. The existing unlicensed spectrum is beginning to see some issues from interference of home devices. With responsible use of spectrum that is unused we can ensure that we will not impact the spectrum that is in use. Our area does not contain many broadcasters so there is undoubtedly a great deal of spectrum that isn't providing a benefit to anyone.
