

I am the President of a Wireless Internet Service Provider serving rural areas of Northern California. These customers cannot get DSL or Cable. Current wireless technology requires line of site from our customers to one of our antennas. To reach our entire area, we would have to put up hundreds if not thousands of unsightly towers. However, there is a solution that does exist which would provide 100% coverage without line of site. We need those TV channels offered up under the FCC 04-186 NPRM. Please move forward with this so we can help serve the millions of U.S. citizens who cannot get broadband internet services without it. Our nation is continually falling behind other countries in creating the infrastructure to provide Broadband. Thank you.
