

I would like to take a second of your time and propose that instead of using the 700 MHz channels that are currently being used for in-efficient analog TV, be re-distributed to current ISPs that are working in rural areas.

The lower bands allows us to penetrate the trees to provide services that are much needed to our communities. I have people leaving my town because there are no options for internet. Jobs require it, and children need it for research. Please consider using it for rural WISPs to provide broadband.

Thank you for your time,

Respectfully,

Eric Rogers
