

In my area, this area of radio spectrum is desperately needed for wireless broadband communication. It would make rural, low-density deployments vastly more cost-effective, by increasing the range that a single access point can serve. Without this sort of spectrum, wireless broadband for rural areas is a difficult and expensive undertaking. Providing for unlicensed access gives wireless internet service providers room to grow, and allows them to provide new services such as IPTV, mobile voice-over-IP, and more.
