

I support the Amateur regulation by bandwidth concept. I feel it will allow communications advancements without burdening the FCC considering every new digital mode developed. I feel the goal should be to allow compatible communications in each band segment. Many digital transmissions can exist with very little separation, but they would cause issues if close to voice communications. I feel this proposal will allow amateur advancement of communication technologies while reducing the burden on the FCC to determine which digital modes can exist in the current CW portions of the band.

Thank you for your consideration,

Morris Jones
