

I believe that the TV white space frequencies should be unlicensed spectrum and not auctioned.

The current unlicensed model has been tremendously successful. Broadband Internet access has been brought to areas of the country, by wireless ISP's, that many licensed providers would still not serve.

Because of the success of the unlicensed frequencies, the spectrums are becoming increasingly full making continued broadband growth and collocation of providers difficult.

Until more of the licensed spectrums are put into use it is in the best interest of the people to allow for unlicensed deployment.
