

The following statement seems correct to me:

"The FCC must ensure that the upcoming auction sets aside at least 30 MHz of spectrum for open and non-discriminatory Internet access. This will guarantee that new entrants have the opportunity to enter the market in competition with incumbent providers."

Cable was founded on public access. That was a good idea, and those public access channels remain an insurance policy against the domination of the airwaves by one or two corporate cultures, and their moreys. "Few take advantage of them", is not an argument for their uselessness.

The same should apply to the wireless spectrum opened by the TV networks.
