

The airwaves you manage are public domain. The very charter of the FCC is to ensure that this asset is used to the benefit of the public. At some point we forgot this fact and have come to accept commercial television and radio waves as the "property" of the carrier. The requirement for public interest programming has become so watered down it's completely worthless.

It is time to put some credibility and respect back into the FCC's role as gatekeeper. Do not simply hand over control of these frequencies to the telecom cartel.

Identical in principle to public access cable channels, there must be **GENEROUS** frequencies reserved for public access providers if the airwaves are to be used for internet services. This is a public service. Do not forget who you work for.
