

In a market where there is actually competition, such things as "Net Neutrality" would be moot. However, data has no choice but to go over a select few routes to move from destination to destination. Net Neutrality ensures that there is a free (as in freedom) and open means by which information can be exchanged. Without it greedy and monopolistic companies (AT&T, I'm looking at you) will make it so expensive that online business will relocate to other countries and we will fall further and further behind the rest of the world in the adoption of new tech (see Broadband Adoption Rates). For the sake of the country, the economy, and the children, Net Neutrality is a must.
