

Neutral net a backbone of intense creativity

Free flow of information and equal access and free competition based upon merits rather than class of membership, these are principles that have made our economy the most creative and productive the world has seen.

Net neutrality has enhanced this underlying processes and has led to the development of new technologies at an amazing rate. Some businesses based upon access have been hurt, but only because they were not as efficient.

Net neutrality has also been a huge factor in making news and technical information readily available. This occurs without and corporate or governmental organization just because people want to know.

In the long run net neutrality will become an established principle because people understand its value. But we are in a critical situation due to environmental change and globalization. We can not afford to have this resource even temporarily diminished.

If the content neutrality is the law, there will still be room for competition in selling neutral bandwidth. It will be up to creators and consumers of content how they want to use the bandwidth.

Please establish a firm content neutral policy now. Mankind can not afford to have this essential resource for free flow of information diminished.
