

Ref: Network Management Practices
Dear FCC,
No matter which Network Management Practices ISPs want to implement they should follow the TCP/IP protocol standard. In this case Comcast is breaking the standard by intercepting and modifying network packages to block communication of certain protocols. This forces protocol implementors to create workarounds for this specific vendor. If every ISP is allowed to break the TCP/IP standard their own way, we will soon have chaos and the inability to communicate between ISPs.

Would you allow a phone company to modify their circuits to drop calls to destinations they don't like when under heavy traffic?. Would you allow a TV broadcaster to slightly modify the ATSC standard so only certain brand of TV can pick up their signal? I believe in both cases the offender would be fined.

Although not a Comcast customer, I strongly oppose their practices regarding this and I believe the FCC should stop them from breaking standards.

Respectfully,
Victor Perez
