

The widening of digital bandwidth signals from 500 Hz to 3 kHz will be a nightmare for HF CW operators. Where one RTTY station is operating many CW operators could be operating....CW is much more efficient use of the bands. The digital signals that are already on the radio bands are so strong and broadbanded that they literally shut the bands down for CW operators at times, to add yet more digital bandwidth would be murder. Please keep anymore digital signals from being used in the HF frequencies. Tnx!
