

Hey Kevin Martin do your job! How about being there is so much interest in the Sat spectrum (at least when minorities expect it for free) that you do this. How is this for an Solution. Take the adjacent spectrum that was not auctioned off originally (you know the other 25 MHz) and sell some of it to the interested parties. They could buy one of the XM sats that have been floating around up there, and have a Minority/free service. And also change the FM frequencies slightly by assigning the freq 88.1 for personal fm transmitters, to prevent interference and to help improve the customer experience.

So you can make money for our economy, to help offset your unproductive pay for the last 15 months. This would solve all the problems just by selling the spectrum to all the parties interested in my companies' assets.

Signed;

Disappointed American
