

As a regular user of wireless microphones and in ear monitoring systems I feel as though the white spaces issues is going to cause massive problems to things that everyone in this country takes for granted. A few of those things would be church services as well as popular television shows. Without proper sensing technologies within these white spaces devices many American pastimes will be interrupted as the wireless microphones that performers are wearing, or their pastor is wearing, or the white hat at an NFL football game is wearing ceases to work (or now inaudible) because a device was not capable of sensing the already in use frequencies. It is essential that you designate some TV channels as off-limits to all White Space Devices, and require them to utilize geo-location and database access rather than the spectrum-sensing technology that has proven inadequate.
